

8-bit Microcontrollers

New 8FX MB95690K Series

MB95F694K/F696K/F698K

■ DESCRIPTION

The MB95690K Series is a series of general-purpose, single-chip microcontrollers. In addition to a compact instruction set, the microcontrollers of these series contain a variety of peripheral resources.

■ FEATURES

- F²MC-8FX CPU core

Instruction set optimized for controllers

- Multiplication and division instructions
- 16-bit arithmetic operations
- Bit test branch instructions
- Bit manipulation instructions, etc.

Note: F²MC is the abbreviation of FUJITSU Flexible Microcontroller.

- Clock

- Selectable main clock source

Main oscillation clock (up to 16.25 MHz, maximum machine clock frequency: 8.125 MHz)

External clock (up to 32.5 MHz, maximum machine clock frequency: 16.25 MHz)

Main CR clock (4 MHz \pm 2%)

Main CR PLL clock

The main CR PLL clock frequency becomes 8 MHz \pm 2% when the PLL multiplier is 2.

The main CR PLL clock frequency becomes 10 MHz \pm 2% when the PLL multiplier is 2.5.

The main CR PLL clock frequency becomes 12 MHz \pm 2% when the PLL multiplier is 3.

The main CR PLL clock frequency becomes 16 MHz \pm 2% when the PLL multiplier is 4.

- Selectable subclock source

Sub-oscillation clock (32.768 kHz)

External clock (32.768 kHz)

Sub-CR clock (Typ: 100 kHz, Min: 50 kHz, Max: 150 kHz)

- Timer

- 8/16-bit composite timer \times 2 channels
- 8/16-bit PPG \times 3 channels
- 16-bit PPG timer \times 1 channel (can work independently or together with the multi-pulse generator)
- 16-bit reload timer \times 1 channel (can work independently or together with the multi-pulse generator)
- Time-base timer \times 1 channel
- Watch prescaler \times 1 channel

FUJITSU SEMICONDUCTOR provides information facilitating product development via the following website. The website contains information useful for customers.

<http://edevic.fujitsu.com/micom/en-support/>

MB95690K Series

(Continued)

- UART/SIO × 1 channel
 - Full duplex double buffer
 - Capable of clock-asynchronized (UART) serial data transfer and clock-synchronized (SIO) serial data transfer
- I²C bus interface × 1 channel
 - Built-in wake-up function
- Multi-pulse generator (MPG) (for DC motor control) × 1 channel
 - 16-bit reload timer × 1 channel
 - 16-bit PPG timer × 1 channel
 - Waveform sequencer (including a 16-bit timer equipped with a buffer and a compare clear function)
- LIN-UART
 - Full duplex double buffer
 - Capable of clock-asynchronized serial data transfer and clock-synchronized serial data transfer
- External interrupt × 8 channels
 - Interrupt by edge detection (rising edge, falling edge, and both edges can be selected)
 - Can be used to wake up the device from different low power consumption (standby) modes
- 8/10-bit A/D converter × 12 channels
 - 8-bit or 10-bit resolution can be selected.
- Low power consumption (standby) modes
 - There are four standby modes as follows:
 - Stop mode
 - Sleep mode
 - Watch mode
 - Time-base timer mode
 - In standby mode, two further options can be selected: normal standby mode and deep standby mode.
- I/O port (no. of I/O ports: 45)
 - General-purpose I/O ports (CMOS I/O) : 41
 - General-purpose I/O ports (N-ch open drain) : 4
- On-chip debug
 - 1-wire serial control
 - Serial writing supported (asynchronous mode)
- Hardware/software watchdog timer
 - Built-in hardware watchdog timer
 - Built-in software watchdog timer
- Power-on reset
 - A power-on reset is generated when the power is switched on.
- Low-voltage detection (LVD) reset circuit
 - The LVD function is enabled by default. For details, see “2. Recommended Operating Conditions” in “■ ELECTRICAL CHARACTERISTICS”.
 - The LVD function can be controlled through software.
 - The LVD reset circuit control register (LVDCC) enables or disables the LVD reset.
 - The LVD reset circuit has an internal low-voltage detector. The combination of detection voltage and release voltage can be selected from four options.
- Comparator × 2 channels
 - Built-in dedicated BGR
 - The comparator reference voltage can be selected between the BGR voltage and the comparator pin.
- Clock supervisor counter
 - Built-in clock supervisor counter
- Dual operation Flash memory
 - The program/erase operation and the read operation can be executed in different banks (upper bank/lower bank) simultaneously.
- Flash memory security function
 - Protects the content of the Flash memory.

■ PRODUCT LINE-UP

Part number	MB95F694K	MB95F696K	MB95F698K
Parameter			
Type	Flash memory product		
Clock supervisor counter	It supervises the main clock oscillation and the subclock oscillation.		
Flash memory capacity	20 Kbyte	36 Kbyte	60 Kbyte
RAM capacity	512 bytes	1 Kbyte	2 Kbyte
Power-on reset	Yes		
Low-voltage detection reset	Controlled through software		
Reset input	Selected through software		
CPU functions	<ul style="list-style-type: none"> • Number of basic instructions : 136 • Instruction bit length : 8 bits • Instruction length : 1 to 3 bytes • Data bit length : 1, 8 and 16 bits • Minimum instruction execution time : 61.5 ns (machine clock frequency = 16.25 MHz) • Interrupt processing time : 0.6 μs (machine clock frequency = 16.25 MHz) 		
General-purpose I/O	<ul style="list-style-type: none"> • I/O port : 45 • CMOS I/O : 41 • N-ch open drain : 4 		
Time-base timer	Interval time: 0.256 ms to 8.3 s (external clock frequency = 4 MHz)		
Hardware/software watchdog timer	<ul style="list-style-type: none"> • Reset generation cycle Main oscillation clock at 10 MHz: 105 ms (Min) • The sub-CR clock can be used as the source clock of the software watchdog timer. 		
Wild register	It can be used to replace 3 bytes of data.		
LIN-UART	<ul style="list-style-type: none"> • A wide range of communication speed can be selected by a dedicated reload timer. • It has a full duplex double buffer. • Clock-synchronized serial data transfer and clock-asynchronized serial data transfer is enabled. • The LIN function can be used as a LIN master or a LIN slave. 		
8/10-bit A/D converter	12 channels 8-bit or 10-bit resolution can be selected.		
8/16-bit composite timer	2 channels <ul style="list-style-type: none"> • The timer can be configured as an “8-bit timer × 2 channels” or a “16-bit timer × 1 channel”. • It has the following functions: interval timer function, PWC function, PWM function and input capture function. • Count clock: it can be selected from internal clocks (seven types) and external clocks. • It can output square wave. 		
External interrupt	8 channels <ul style="list-style-type: none"> • Interrupt by edge detection (The rising edge, falling edge, and both edges can be selected.) • It can be used to wake up the device from different standby modes. 		
On-chip debug	<ul style="list-style-type: none"> • 1-wire serial control • It supports serial writing (asynchronous mode).

MB95690K Series

Part number	MB95F694K	MB95F696K	MB95F698K	
Parameter				
UART/SIO	1 channel			
	<ul style="list-style-type: none"> Data transfer with UART/SIO is enabled. It has a full duplex double buffer, variable data length (5/6/7/8 bits), an internal baud rate generator and an error detection function. It uses the NRZ type transfer format. LSB-first data transfer and MSB-first data transfer are available to use. Clock-asynchronized (UART) serial data transfer and clock-synchronized (SIO) serial data transfer is enabled. 			
I ² C bus interface	1 channel			
	<ul style="list-style-type: none"> Master/slave transmission and receiving It has the following functions: bus error function, arbitration function, transmission direction detection function, wake-up function, and functions of generating and detecting repeated START conditions. 			
8/16-bit PPG	3 channels			
	<ul style="list-style-type: none"> Each channel can be used as an "8-bit timer × 2 channels" or a "16-bit timer × 1 channel". The counter operating clock can be selected from eight clock sources. 			
16-bit PPG timer	1 channel			
	<ul style="list-style-type: none"> PWM mode and one-shot mode are available to use. The counter operating clock can be selected from eight clock sources. It supports external trigger start. It can work independently or together with the multi-pulse generator. 			
16-bit reload timer	1 channel			
	<ul style="list-style-type: none"> Two clock modes and two counter operating modes are available to use. It can output square wave. Count clock: it can be selected from internal clocks (seven types) and external clocks. Two counter operating modes: reload mode and one-shot mode It can work independently or together with the multi-pulse generator. 			
Multi-pulse generator (for DC motor control)	<ul style="list-style-type: none"> 16-bit PPG timer: 1 channel 16-bit reload timer operations: toggle output, one-shot output Event counter: 1 channel Waveform sequencer (including a 16-bit timer equipped with a buffer and a compare clear function) 			
Watch prescaler	Eight different time intervals can be selected.			
Comparator	2 channels			
	The reference voltage of each channel can be selected between the BGR voltage and the comparator pin.			
Flash memory	<ul style="list-style-type: none"> It supports automatic programming (Embedded Algorithm), and program/erase/erase-suspend/erase-resume commands. It has a flag indicating the completion of the operation of Embedded Algorithm. Flash security feature for protecting the content of the Flash memory 			
	Number of program/erase cycles	1000	10000	100000
	Data retention time	20 years	10 years	5 years

■ DIFFERENCES AMONG PRODUCTS AND NOTES ON PRODUCT SELECTION

- Current consumption
When using the on-chip debug function, take account of the current consumption of Flash program/erase.
For details of current consumption, see “■ ELECTRICAL CHARACTERISTICS”.
- Package
For details of information on each package, see “■ PACKAGES AND CORRESPONDING PRODUCTS” and “■ PACKAGE DIMENSION”.
- Operating voltage
The operating voltage varies, depending on whether the on-chip debug function is used or not.
For details of operating voltage, see “■ ELECTRICAL CHARACTERISTICS”.
- On-chip debug function
The on-chip debug function requires that V_{CC} , V_{SS} and one serial wire be connected to an evaluation tool.
For details of the connection method, refer to “CHAPTER 25 EXAMPLE OF SERIAL PROGRAMMING CONNECTION” in the hardware manual of the MB95690K Series.

MB95690K Series

PIN ASSIGNMENT

*1: High-current pin (8 mA/12 mA)

*2: The 8/16-bit PPG output pins are mapped to port 1 by default. To map the 8/16-bit PPG output pins to port 6, write "1" to the PPGSEL bit in the SYSC register.

(Continued)

Type	Circuit	Remarks
I	<p>The circuit diagram shows a CMOS output stage. It features a pull-up resistor (R) connected to a supply rail. The output node is connected to the gates of two MOSFETs: a P-channel MOSFET (P-ch) and an N-channel MOSFET (N-ch). The gates of both MOSFETs are connected to a common node that is also connected to a pull-up control signal through an inverter. The source of the P-ch MOSFET is connected to the supply rail, and the source of the N-ch MOSFET is connected to ground. The drain of the P-ch MOSFET is connected to the output node, and the drain of the N-ch MOSFET is also connected to the output node. The output node is labeled as 'Digital output'. A standby control signal is connected to the gates of both MOSFETs through an AND gate. The CMOS input signal is connected to the gates of both MOSFETs through an AND gate.</p>	<ul style="list-style-type: none"> • CMOS output • CMOS input • Pull-up control

■ HANDLING PRECAUTIONS

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your FUJITSU SEMICONDUCTOR semiconductor devices.

1. Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

● Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

● Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

● Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

(1) Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

(2) Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device.

Therefore, avoid this type of connection.

(3) Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

MB95690K Series

- **Latch-up**

Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNP junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

CAUTION: The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

- (1) Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.
- (2) Be sure that abnormal current flows do not occur during the power-on sequence.

- **Observance of Safety Regulations and Standards**

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

- **Fail-Safe Design**

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

- **Precautions Related to Usage of Devices**

FUJITSU SEMICONDUCTOR semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION: Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

2. Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under FUJITSU SEMICONDUCTOR's recommended conditions. For detailed information about mount conditions, contact your sales representative.

- **Lead Insertion Type**

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to FUJITSU SEMICONDUCTOR recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

• Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. FUJITSU SEMICONDUCTOR recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with FUJITSU SEMICONDUCTOR ranking of recommended conditions.

• Lead-Free Packaging

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

• Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

- (1) Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
- (2) Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5 °C and 30 °C.
When you open Dry Package that recommends humidity 40% to 70% relative humidity.
- (3) When necessary, FUJITSU SEMICONDUCTOR packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
- (4) Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

• Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the FUJITSU SEMICONDUCTOR recommended conditions for baking.

Condition: 125 °C/24 h

• Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

- (1) Maintain relative humidity in the working environment between 40% and 70%.
Use of an apparatus for ion generation may be needed to remove electricity.
- (2) Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
- (3) Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 M Ω).
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
- (4) Ground all fixtures and instruments, or protect with anti-static measures.
- (5) Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

3. Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

(1) Humidity

Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.

(2) Discharge of Static Electricity

When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.

(3) Corrosive Gases, Dust, or Oil

Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.

(4) Radiation, Including Cosmic Radiation

Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.

(5) Smoke, Flame

CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of FUJITSU SEMICONDUCTOR products in other special environmental conditions should consult with sales representatives.

Please check the latest handling precautions at the following URL.

■ NOTES ON DEVICE HANDLING

• Preventing latch-ups

When using the device, ensure that the voltage applied does not exceed the maximum voltage rating.

In a CMOS IC, if a voltage higher than V_{CC} or a voltage lower than V_{SS} is applied to an input/output pin that is neither a medium-withstand voltage pin nor a high-withstand voltage pin, or if a voltage out of the rating range of power supply voltage mentioned in “1. Absolute Maximum Ratings” of “■ ELECTRICAL CHARACTERISTICS” is applied to the V_{CC} pin or the V_{SS} pin, a latch-up may occur.

When a latch-up occurs, power supply current increases significantly, which may cause a component to be thermally destroyed.

• Stabilizing supply voltage

Supply voltage must be stabilized.

A malfunction may occur when power supply voltage fluctuates rapidly even though the fluctuation is within the guaranteed operating range of the V_{CC} power supply voltage.

As a rule of voltage stabilization, suppress voltage fluctuation so that the fluctuation in V_{CC} ripple (p-p value) at the commercial frequency (50 Hz/60 Hz) does not exceed 10% of the standard V_{CC} value, and the transient fluctuation rate does not exceed 0.1 V/ms at a momentary fluctuation such as switching the power supply.

• Notes on using the external clock

When an external clock is used, oscillation stabilization wait time is required for power-on reset, wake-up from subclock mode or stop mode.

■ PIN CONNECTION

• Treatment of unused pins

If an unused input pin is left unconnected, a component may be permanently damaged due to malfunctions or latch-ups. Always pull up or pull down an unused input pin through a resistor of at least 2 k Ω . Set an unused input/output pin to the output state and leave it unconnected, or set it to the input state and treat it the same as an unused input pin. If there is an unused output pin, leave it unconnected.

• Power supply pins

To reduce unnecessary electro-magnetic emission, prevent malfunctions of strobe signals due to an increase in the ground level, and conform to the total output current standard, always connect the V_{CC} pin and the V_{SS} pin to the power supply and ground outside the device. In addition, connect the current supply source to the V_{CC} pin and the V_{SS} pin with low impedance.

It is also advisable to connect a ceramic capacitor of approximately 0.1 μF as a bypass capacitor between the V_{CC} pin and the V_{SS} pin at a location close to this device.

• DBG pin

Connect the DBG pin directly to an external pull-up resistor.

To prevent the device from unintentionally entering the debug mode due to noise, minimize the distance between the DBG pin and the V_{CC} or V_{SS} pin when designing the layout of the printed circuit board.

The DBG pin should not stay at “L” level after power-on until the reset output is released.

• $\overline{\text{RST}}$ pin

Connect the $\overline{\text{RST}}$ pin directly to an external pull-up resistor.

To prevent the device from unintentionally entering the reset mode due to noise, minimize the distance between the $\overline{\text{RST}}$ pin and the V_{CC} or V_{SS} pin when designing the layout of the printed circuit board.

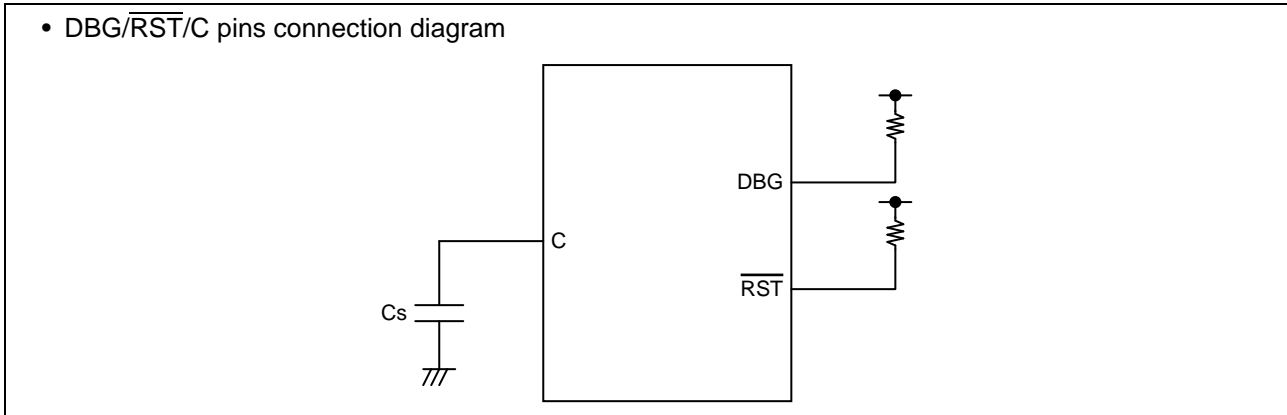

The PF2/ $\overline{\text{RST}}$ pin functions as the reset input/output pin after power-on. In addition, the reset output of the PF2/ $\overline{\text{RST}}$ pin can be enabled by the RSTOE bit in the SYSC register, and the reset input function and the general purpose I/O function can be selected by the RSTEN bit in the SYSC register.

MB95690K Series

- C pin

Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. The bypass capacitor for the V_{CC} pin must have a capacitance larger than C_s. For the connection to a decoupling capacitor C_s, see the diagram below. To prevent the device from unintentionally entering a mode to which the device is not set to transit due to noise, minimize the distance between the C pin and C_s and the distance between C_s and the V_{SS} pin when designing the layout of a printed circuit board.

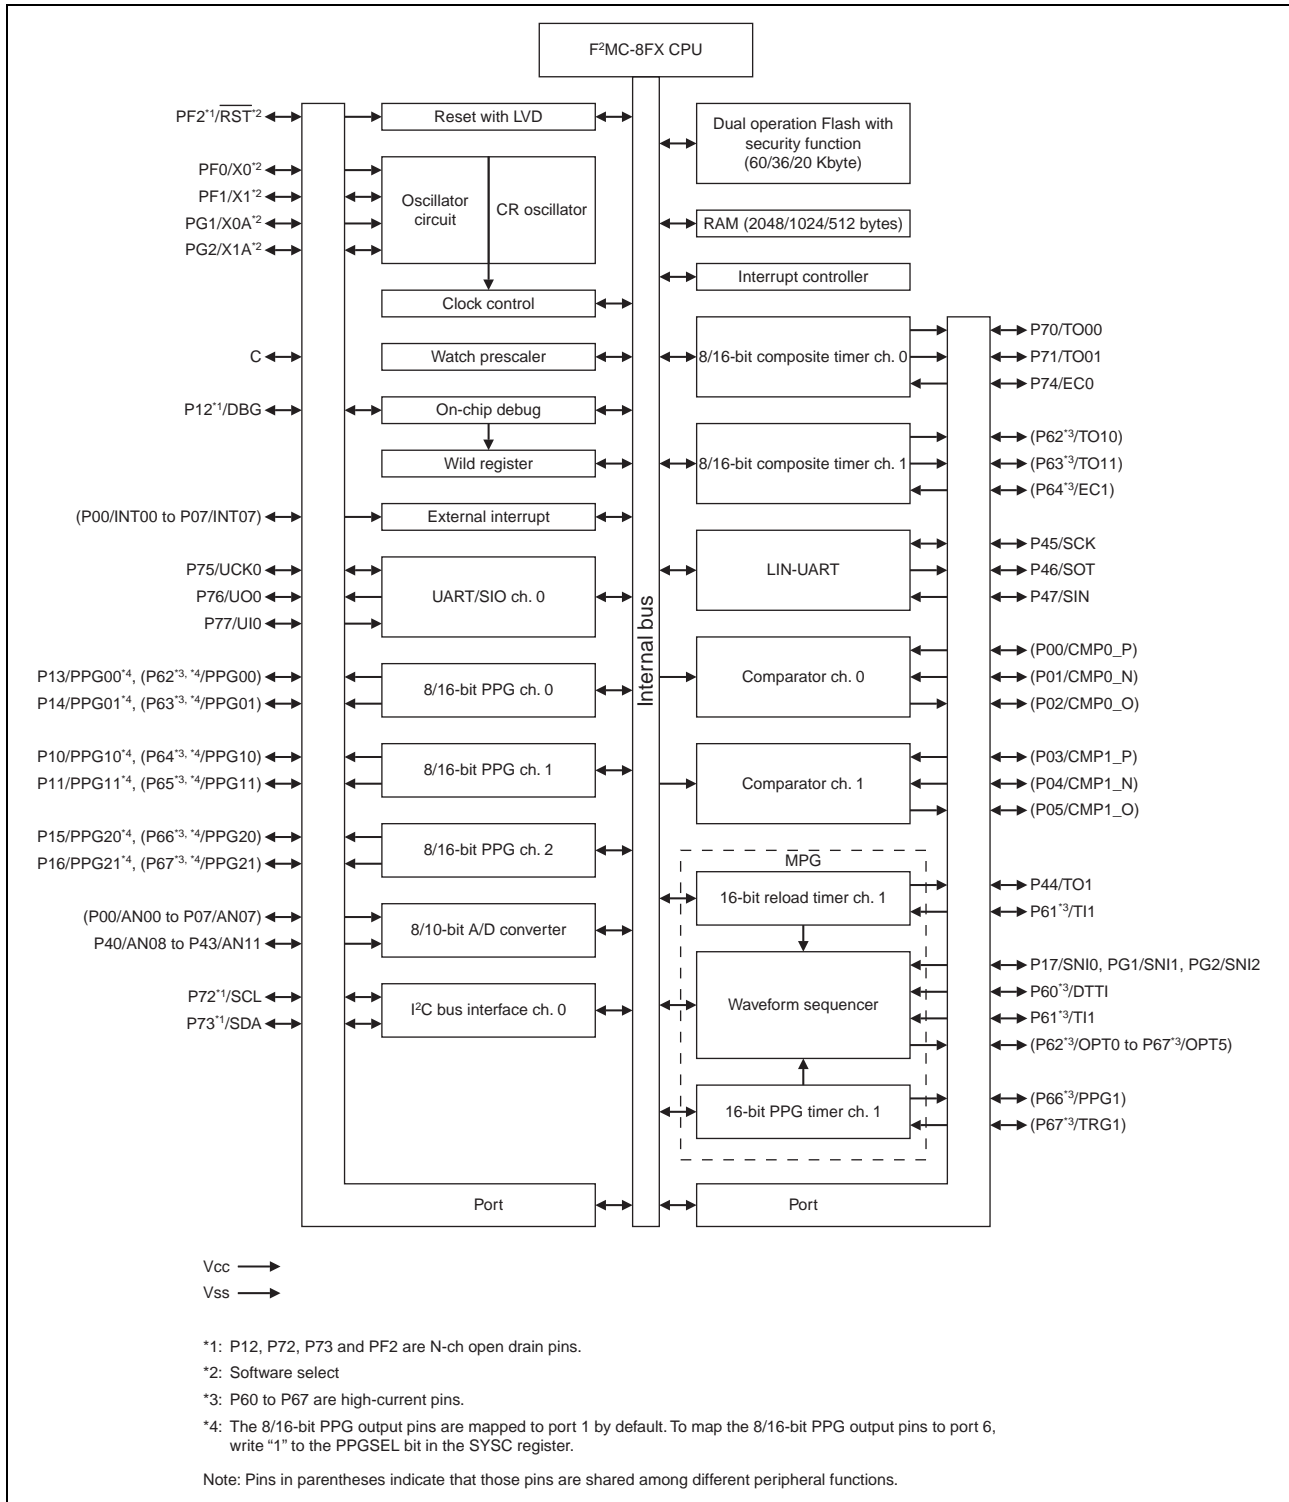

- DBG/ $\overline{\text{RST}}$ /C pins connection diagram

- Note on serial communication

In serial communication, reception of wrong data may occur due to noise or other causes. Therefore, design a printed circuit board to prevent noise from occurring. Taking account of the reception of wrong data, take measures such as adding a checksum to the end of data in order to detect errors. If an error is detected, retransmit the data.

■ BLOCK DIAGRAM

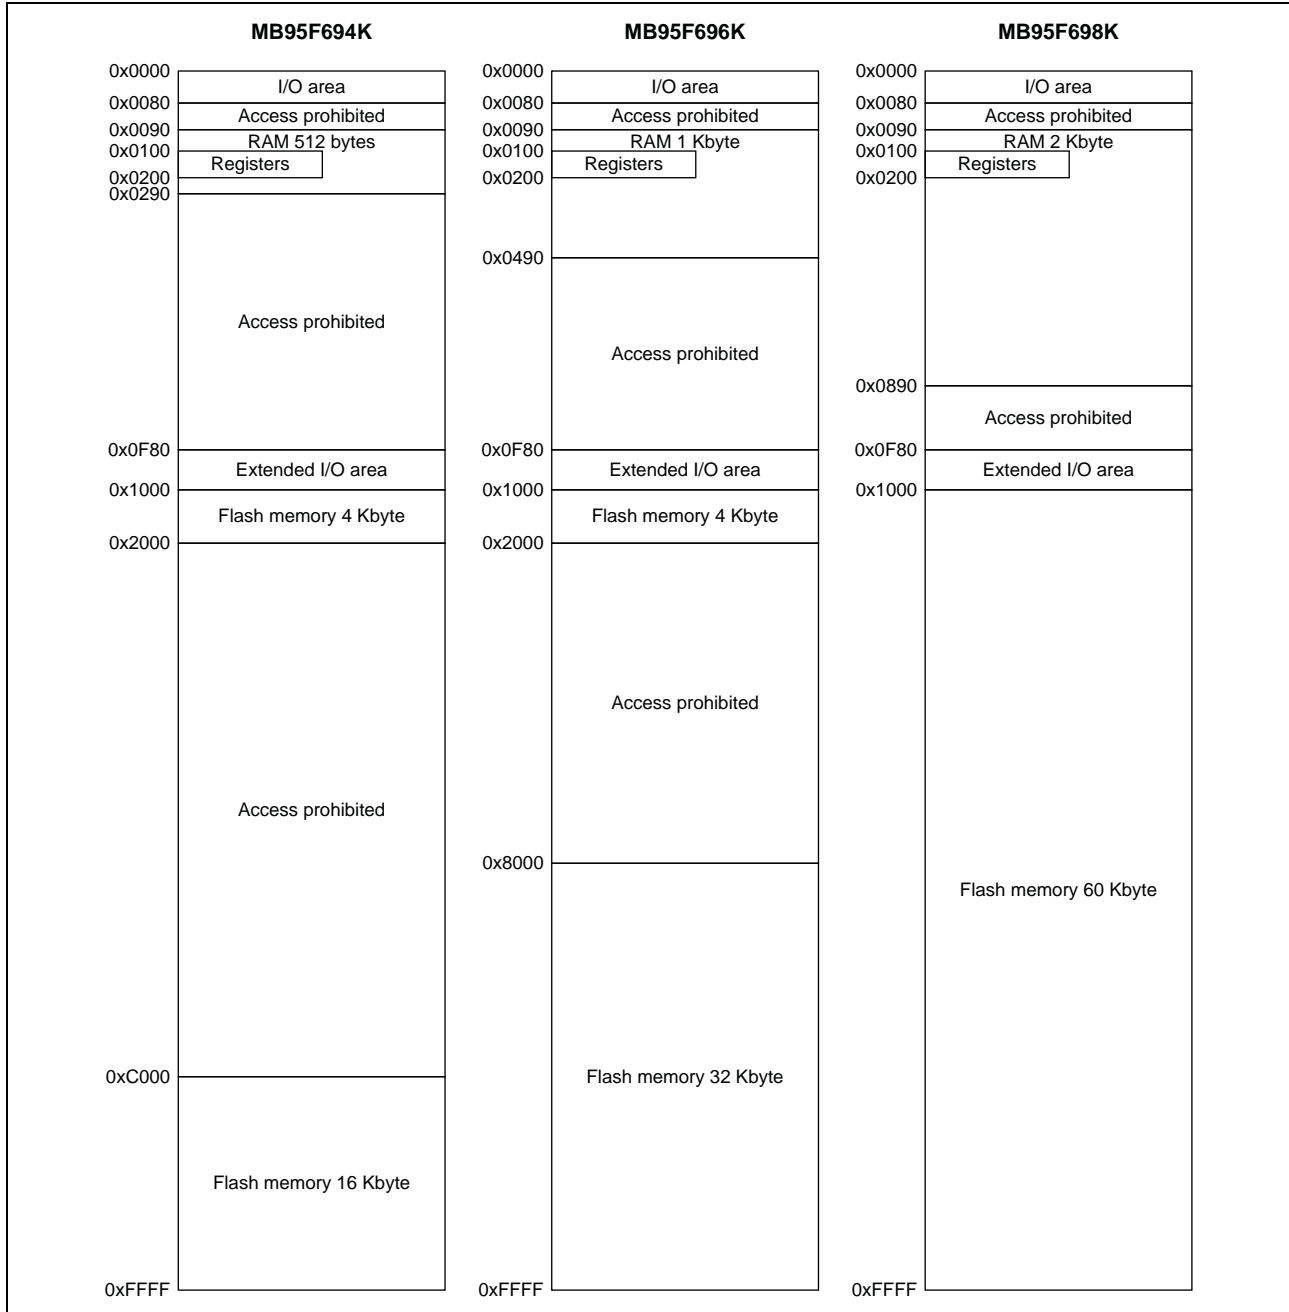

MB95690K Series

■ CPU CORE

- Memory space

The memory space of the MB95690K Series is 64 Kbyte in size, and consists of an I/O area, an extended I/O area, a data area, and a program area. The memory space includes areas intended for specific purposes such as general-purpose registers and a vector table. The memory maps of the MB95690K Series are shown below.

- Memory maps

■ MEMORY SPACE

The memory space of the MB95690K Series is 64 Kbyte in size, and consists of an I/O area, an extended I/O area, a data area, and a program area. The memory space includes areas for specific applications such as general-purpose registers and a vector table.

- I/O area (addresses: 0x0000 to 0x007F)
 - This area contains the control registers and data registers for built-in peripheral functions.
 - As the I/O area forms part of the memory space, it can be accessed in the same way as the memory. It can also be accessed at high-speed by using direct addressing instructions.

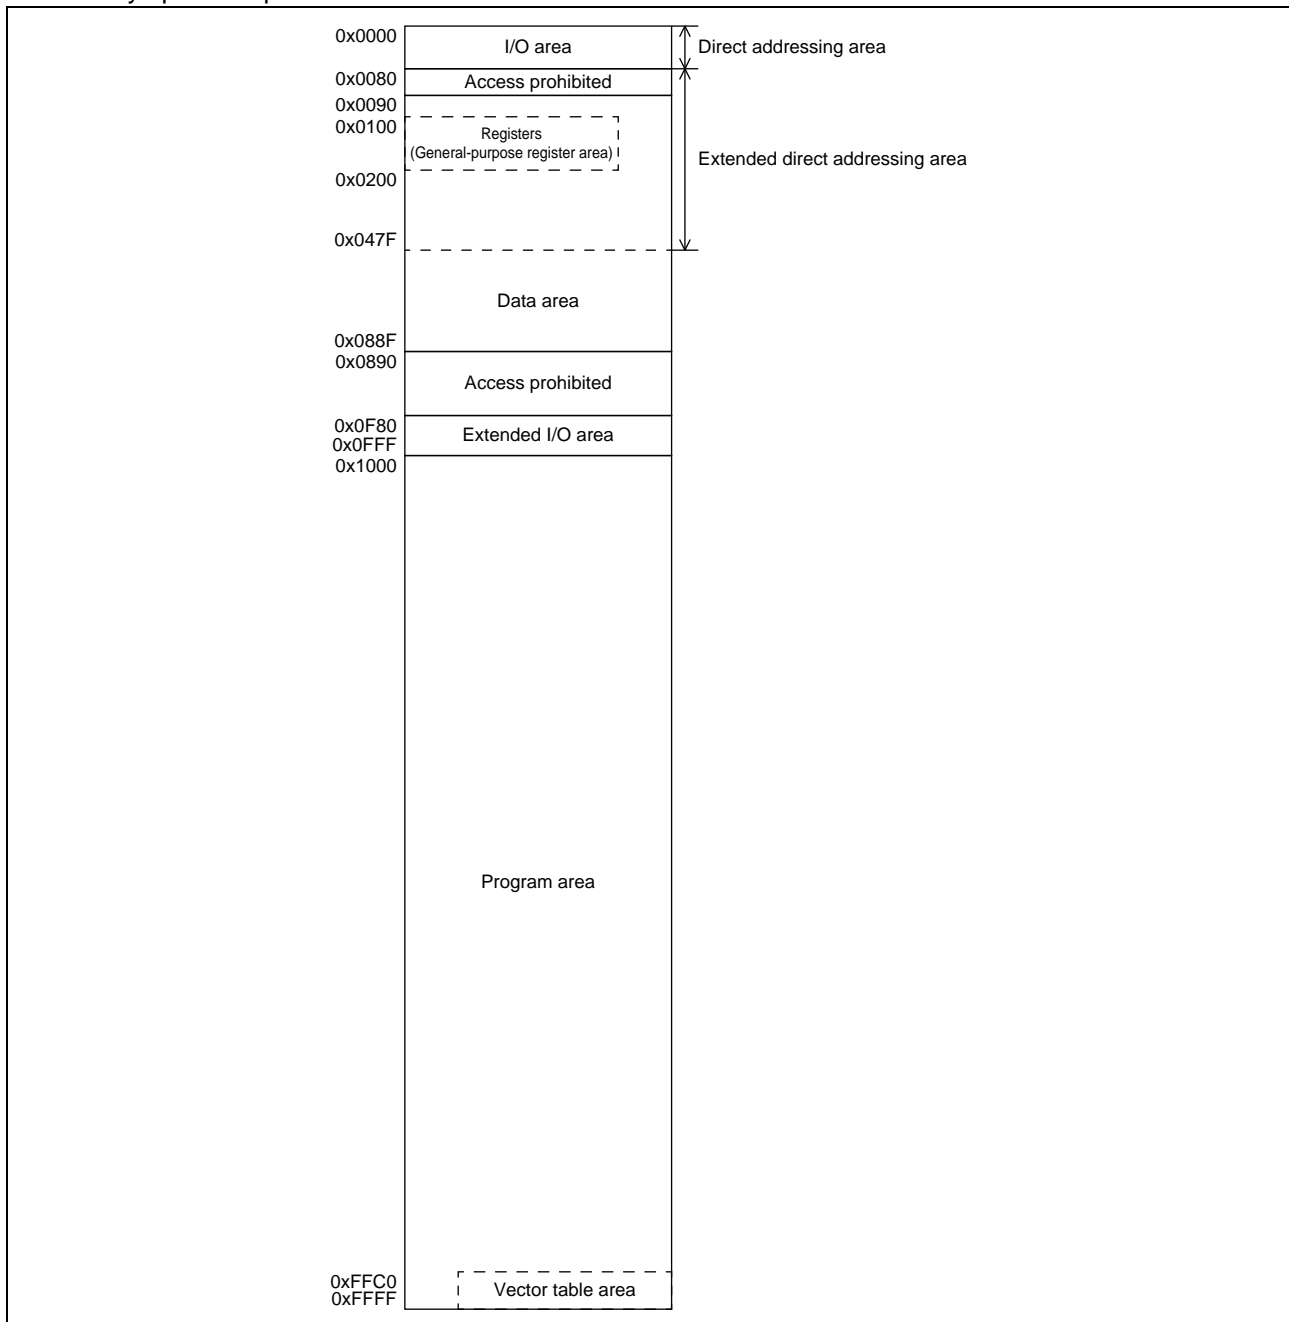

- Extended I/O area (addresses: 0x0F80 to 0x0FFF)
 - This area contains the control registers and data registers for built-in peripheral functions.
 - As the extended I/O area forms part of the memory space, it can be accessed in the same way as the memory.

- Data area
 - Static RAM is incorporated in the data area as the internal data area.
 - The internal RAM size varies according to product.
 - The RAM area from 0x0090 to 0x00FF can be accessed at high-speed by using direct addressing instructions.
 - In MB95F698K, the area from 0x0090 to 0x047F is an extended direct addressing area. It can be accessed at high-speed by direct addressing instructions with a direct bank pointer set.
 - In MB95F696K, the area from 0x0090 to 0x047F is an extended direct addressing area. It can be accessed at high-speed by direct addressing instructions with a direct bank pointer set.
 - In MB95F694K, the area from 0x0090 to 0x028F is an extended direct addressing area. It can be accessed at high-speed by direct addressing instructions with a direct bank pointer set.
 - In MB95F694K/F696K/F698K, the area from 0x0100 to 0x01FF can be used as a general-purpose register area.

- Program area
 - The Flash memory is incorporated in the program area as the internal program area.
 - The Flash memory size varies according to product.
 - The area from 0xFFC0 to 0xFFFF is used as the vector table.
 - The area from 0xFFBB to 0xFFBF is used to store data of the non-volatile register.

MB95690K Series

● Memory space map

■ AREAS FOR SPECIFIC APPLICATIONS

The general-purpose register area and vector table area are used for the specific applications.

- General-purpose register area (Addresses: 0x0100 to 0x01FF)
 - This area contains the auxiliary registers used for 8-bit arithmetic operations, transfer, etc.
 - As this area forms part of the RAM area, it can also be used as conventional RAM.
 - When the area is used as general-purpose registers, general-purpose register addressing enables high-speed access with short instructions.
- Non-volatile register data area (Addresses: 0xFFBB to 0xFFBF)
 - The area from 0xFFBB to 0xFFBF is used to store data of the non-volatile register. For details, refer to “CHAPTER 27 NON-VOLATILE REGISTER (NVR) INTERFACE” in the hardware manual of the MB95690K Series.
- Vector table area (Addresses: 0xFFC0 to 0xFFFF)
 - This area is used as the vector table for vector call instructions (CALLV), interrupts, and resets.
 - The top of the Flash memory area is allocated to the vector table area. The start address of a service routine is set to an address in the vector table in the form of data.

“■ INTERRUPT SOURCE TABLE” lists the vector table addresses corresponding to vector call instructions, interrupts, and resets.

For details, refer to “CHAPTER 4 RESET”, “CHAPTER 5 INTERRUPTS” and “A.2 Special Instruction ■ Special Instruction ● CALLV #vct” in “APPENDIX” in the hardware manual of the MB95690K Series.

- Direct bank pointer and access area

Direct bank pointer (DP[2:0])	Operand-specified dir	Access area
0bXXX (It does not affect mapping.)	0x0000 to 0x007F	0x0000 to 0x007F
0b000 (initial value)	0x0090 to 0x00FF	0x0090 to 0x00FF
0b001	0x0080 to 0x00FF	0x0100 to 0x017F
0b010		0x0180 to 0x01FF
0b011		0x0200 to 0x027F
0b100		0x0280 to 0x02FF*1
0b101		0x0300 to 0x037F
0b110		0x0380 to 0x03FF
0b111		0x0400 to 0x047F*2

*1: Due to the memory size limit, the available access area is up to “0x028F” in MB95F694K.

*2: Due to the memory size limit, the available access area is up to “0x047F” in MB95F696K/F698K.

- R/W access symbols
R/W : Readable/Writable
R : Read only
- Initial value symbols
0 : The initial value of this bit is "0".
1 : The initial value of this bit is "1".
X : The initial value of this bit is undefined.

Note: Do not write to an address that is "(Disabled)". If a "(Disabled)" address is read, an indeterminate value is returned.

Port 4 pull-up register	PUL4	R/W	0b00000000
Port 6 pull-up register	PUL6	R/W	0b00000000
Port 7 pull-up register	PUL7	R/W	0b00000000
Port G pull-up register	PULG	R/W	0b00000000
A/D input disable register (upper)	AIDRH	R/W	0b00000000
A/D input disable register (lower)	AIDRL	R/W	0b00000000

R/W : Readable/writable (The read value is the same as the write value.)

R, RM/W : Readable/writable (The read value is different from the write value. The write value is read by the read-modify-write (RMW) type of instruction.)

1. Port 0

Port 0 is a general-purpose I/O port. This section focuses on its functions as a general-purpose I/O port. For details of peripheral functions, refer to their respective chapters in the hardware manual of the MB95690K Series.

(1) Port 0 configuration

Port 0 is made up of the following elements.

- General-purpose I/O pins/peripheral function I/O pins
- Port 0 data register (PDR0)
- Port 0 direction register (DDR0)
- Port 0 pull-up register (PUL0)
- A/D input disable register (lower) (AIDRL)

(2) Block diagrams of port 0

• P00/INT00/AN00/CMP0_P pin

This pin has the following peripheral functions:

- External interrupt input pin (INT00)
- 8/10-bit A/D converter analog input pin (AN00)
- Comparator ch. 0 non-inverting analog input (positive input) pin (CMP0_P)

• P01/INT01/AN01/CMP0_N pin

This pin has the following peripheral functions:

- External interrupt input pin (INT01)
- 8/10-bit A/D converter analog input pin (AN01)
- Comparator ch. 0 inverting analog input (negative input) pin (CMP0_N)

• P03/INT03/AN03/CMP1_P pin

This pin has the following peripheral functions:

- External interrupt input pin (INT03)
- 8/10-bit A/D converter analog input pin (AN03)
- Comparator ch. 1 non-inverting analog input (positive input) pin (CMP1_P)

• P04/INT04/AN04/CMP1_N pin

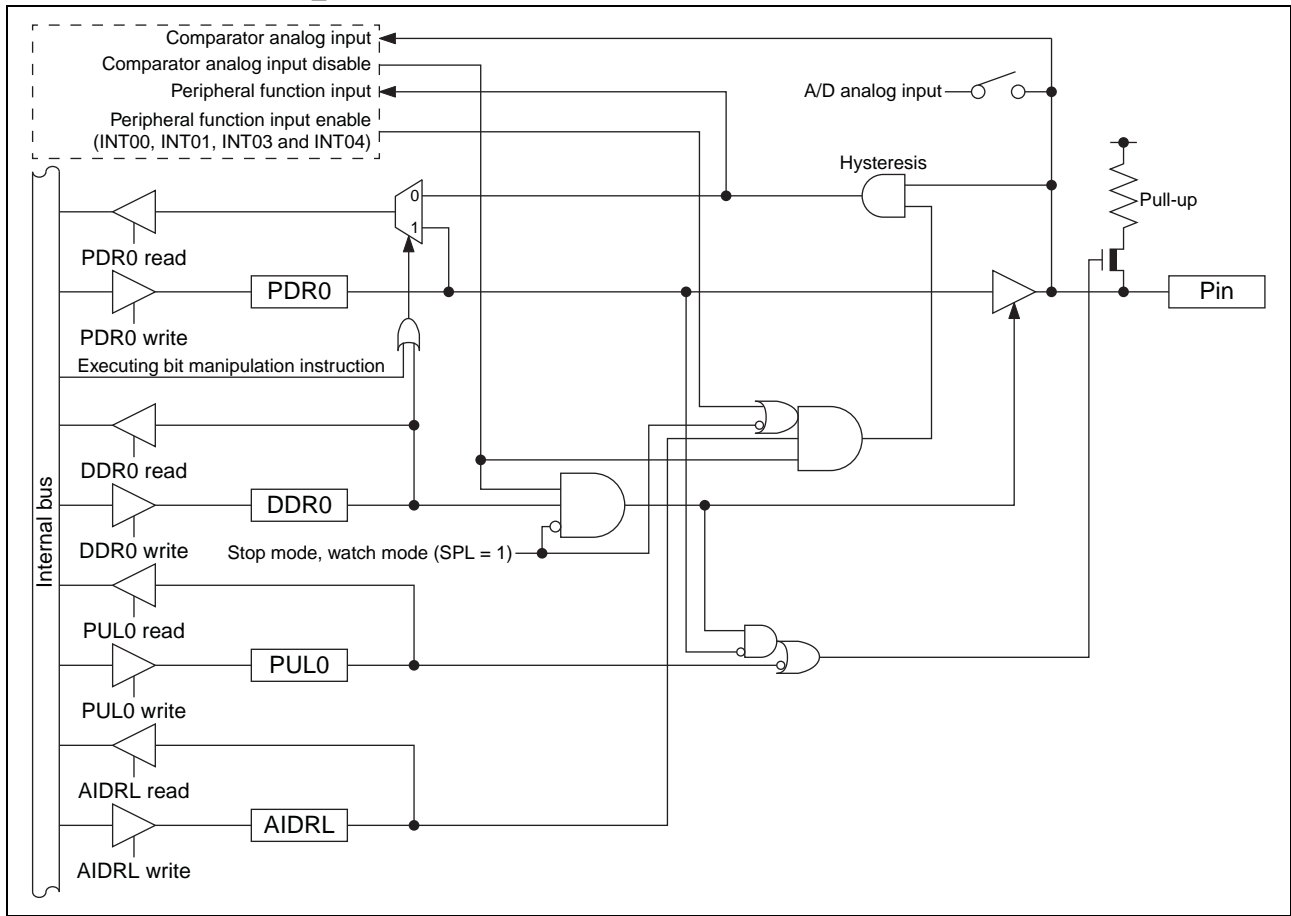

This pin has the following peripheral functions:

- External interrupt input pin (INT04)
- 8/10-bit A/D converter analog input pin (AN04)
- Comparator ch. 1 inverting analog input (negative input) pin (CMP1_N)

(Continued)

- P02/INT02/AN02/CMP0_O pin
This pin has the following peripheral functions:
 - External interrupt input pin (INT02)
 - 8/10-bit A/D converter analog input pin (AN02)
 - Comparator ch. 0 digital output pin (CMP0_O)
- P05/INT05/AN05/CMP1_O pin
This pin has the following peripheral functions:
 - External interrupt input pin (INT05)
 - 8/10-bit A/D converter analog input pin (AN05)
 - Comparator ch. 1 digital output pin (CMP1_O)

• Block diagram of P02/INT02/AN02/CMP0_O and P05/INT05/AN05/CMP1_O

MB95690K Series

(Continued)

- P06/INT06/AN06 pin
 - This pin has the following peripheral functions:
 - External interrupt input pin (INT06)
 - 8/10-bit A/D converter analog input pin (AN06)
- P07/INT07/AN07 pin
 - This pin has the following peripheral functions:
 - External interrupt input pin (INT07)
 - 8/10-bit A/D converter analog input pin (AN07)
- Block diagram of P06/INT06/AN06 and P07/INT07/AN07

(3) Port 0 registers

- Port 0 register functions

Register abbreviation	Data	Read	Read by read-modify-write (RMW) instruction	Write
PDR0	0	Pin state is "L" level.	PDR0 value is "0".	As output port, outputs "L" level.
	1	Pin state is "H" level.	PDR0 value is "1".	As output port, outputs "H" level.
DDR0	0	Port input enabled		
	1	Port output enabled		
PUL0	0	Pull-up disabled		
	1	Pull-up enabled		
AIDRL	0	Analog input enabled		
	1	Port input enabled		

- Correspondence between registers and pins for port 0

Pin name	Correspondence between related register bits and pins							
	P07	P06	P05	P04	P03	P02	P01	P00
PDR0	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
DDR0								
PUL0								
AIDRL								

(4) Port 0 operations

- Operation as an output port
 - A pin becomes an output port if the bit in the DDR0 register corresponding to that pin is set to “1”.
 - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
 - When a pin is used as an output port, it outputs the value of the PDR0 register to external pins.
 - If data is written to the PDR0 register, the value is stored in the output latch and is output to the pin set as an output port as it is.
 - Reading the PDR0 register returns the PDR0 register value.
- Operation as an input port
 - A pin becomes an input port if the bit in the DDR0 register corresponding to that pin is set to “0”.
 - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
 - When using a pin shared with the analog input function as an input port, set the corresponding bit in the A/D input disable register (lower) (AIDRL) to “1”.
 - If data is written to the PDR0 register, the value is stored in the output latch but is not output to the pin set as an input port.
 - Reading the PDR0 register returns the pin value. However, if the read-modify-write (RMW) type of instruction is used to read the PDR0 register, the PDR0 register value is returned.
- Operation as a peripheral function output pin
 - A pin becomes a peripheral function output pin if the peripheral output function is enabled by setting the output enable bit of a peripheral function corresponding to that pin.
 - The pin value can be read from the PDR0 register even if the peripheral function output is enabled. Therefore, the output value of a peripheral function can be read by the read operation on the PDR0 register. However, if the read-modify-write (RMW) type of instruction is used to read the PDR0 register, the PDR0 register value is returned.
- Operation as a peripheral function input pin
 - To set a pin as an input port, set the bit in the DDR0 register corresponding to the input pin of a peripheral function to “0”.
 - When using a pin shared with the analog input function as another peripheral function input pin, configure it as an input port by setting the bit in the AIDRL register corresponding to that pin to “1”.
 - Reading the PDR0 register returns the pin value, regardless of whether the peripheral function uses that pin as its input pin. However, if the read-modify-write (RMW) type of instruction is used to read the PDR0 register, the PDR0 register value is returned.
- Operation at reset

If the CPU is reset, all bits in the DDR0 register are initialized to “0” and port input is enabled. As for a pin shared with the analog input function, its port input is disabled because the AIDRL register is initialized to “0”.
- Operation in stop mode and watch mode
 - If the pin state setting bit in the standby control register (STBC:SPL) is set to “1” and the device transits to stop mode or watch mode, the pin is compulsorily made to enter the high impedance state regardless of the DDR0 register value. The input of that pin is locked to “L” level and blocked in order to prevent leaks due to input open. However, if the interrupt input is enabled for the external interrupt (INT00 to INT07), the input is enabled and not blocked.
 - If the pin state setting bit is “0”, the state of the port I/O or that of the peripheral function I/O remains unchanged and the output level is maintained.
- Operation as an analog input pin
 - Set the bit in the DDR0 register bit corresponding to the analog input pin to “0” and the bit corresponding to that pin in the AIDRL register to “0”.
 - For a pin shared with other peripheral functions, disable the output of such peripheral functions. In addition, set the corresponding bit in the PUL0 register to “0”.

(Continued)

(Continued)

- Operation as an external interrupt input pin
 - Set the bit in the DDR0 register corresponding to the external interrupt input pin to “0”.
 - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
 - The pin value is always input to the external interrupt circuit. When using a pin for a function other than the interrupt, disable the external interrupt function corresponding to that pin.

- Operation of the pull-up register

Setting the bit in the PUL0 register to “1” makes the pull-up resistor be internally connected to the pin. When the pin output is “L” level, the pull-up resistor is disconnected regardless of the value of the PUL0 register.

- Operation as a comparator input pin (only for P00 and P03)
 - Set the bit in the AIDRL register corresponding to the comparator input pin to “0”.
 - Regardless of the value of the PDR0 register and that of the DDR0 register, if the comparator analog input enable bit in the comparator control register ch. 0/ch. 1 (CMR0/CMR1:VCID) is set to “0”, the comparator input function is enabled.
 - To disable the comparator input function, set the VCID bit to “1”.
 - For details of the comparator, refer to “CHAPTER 28 COMPARATOR” in the hardware manual of the MB95690K Series.

- Operation as a comparator input pin (only for P01 and P04)
 - Set the bit in the AIDRL register corresponding to the comparator input pin to “0”.
 - Regardless of the value of the PDR0 register and that of the DDR0 register, if the comparator analog input enable bit (VCID) and the negative analog input voltage source select bit (BGRS) in the comparator control register ch. 0/ch. 1 (CMR0/CMR1) are both set to “0”, the comparator input function is enabled.
 - To disable the comparator input function, set the VCID bit or the BGRS bit to “1”.
 - For details of the comparator, refer to “CHAPTER 28 COMPARATOR” in the hardware manual of the MB95690K Series.

MB95690K Series

2. Port 1

Port 1 is a general-purpose I/O port. This section focuses on its functions as a general-purpose I/O port. For details of peripheral functions, refer to their respective chapters in the hardware manual of the MB95690K Series.

(1) Port 1 configuration

Port 1 is made up of the following elements.

- General-purpose I/O pins/peripheral function I/O pins
- Port 1 data register (PDR1)
- Port 1 direction register (DDR1)
- Port 1 pull-up register (PUL1)

(2) Block diagrams of port 1

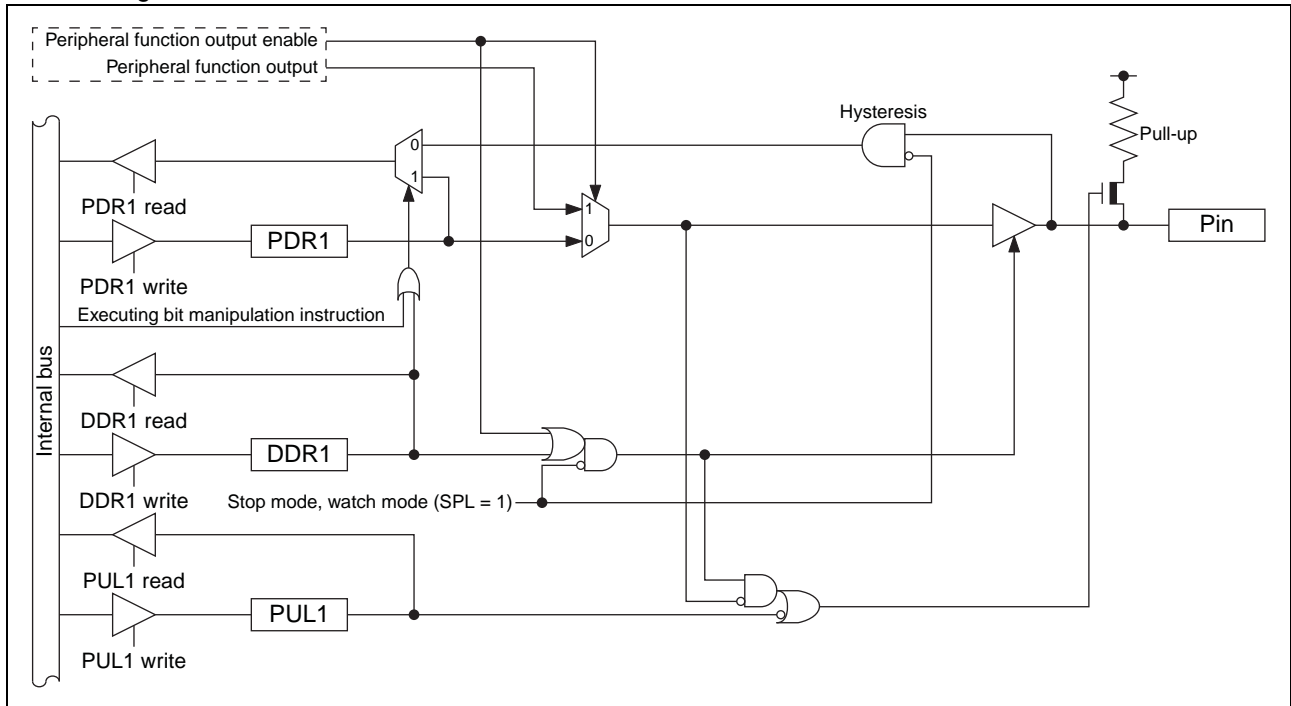

- P10/PPG10* pin
This pin has the following peripheral function:
 - 8/16-bit PPG ch. 1 output pin (PPG10)
- P11/PPG11* pin
This pin has the following peripheral function:
 - 8/16-bit PPG ch. 1 output pin (PPG11)
- P13/PPG00* pin
This pin has the following peripheral function:
 - 8/16-bit PPG ch. 0 output pin (PPG00)
- P14/PPG01* pin
This pin has the following peripheral function:
 - 8/16-bit PPG ch. 0 output pin (PPG01)
- P15/PPG20* pin
This pin has the following peripheral function:
 - 8/16-bit PPG ch. 2 output pin (PPG20)
- P16/PPG21* pin
This pin has the following peripheral function:
 - 8/16-bit PPG ch. 2 output pin (PPG21)

*: The 8/16-bit PPG output pins are mapped to pins according to the setting of the PPGSEL bit in the SYSC register. See the table below for details.

8/16-bit PPG output pin	SYSC:PPGSEL = 0	SYSC:PPGSEL = 1
	Pin	
PPG00	P13	P62
PPG01	P14	P63
PPG10	P10	P64
PPG11	P11	P65
PPG20	P15	P66
PPG21	P16	P67

- P12/DBG pin
 - This pin has the following peripheral function:
 - DBG input pin (DBG)

- Block diagram of P12/DBG

(Continued)

MB95690K Series

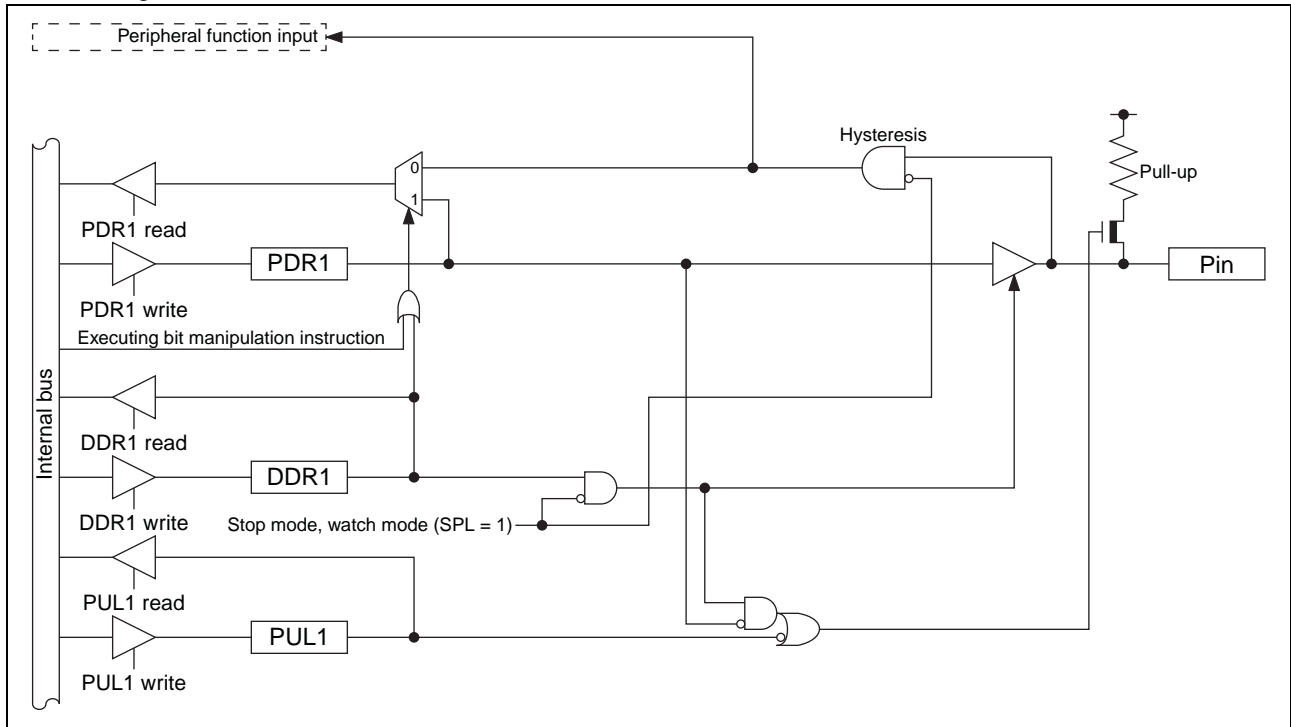

(Continued)

- P17/SNI0 pin

This pin has the following peripheral function:

- Trigger input pin for the position detection function of the MPG waveform sequencer (SNI0)

- Block diagram of P17/SNI0

(3) Port 1 registers

- Port 1 register functions

Register abbreviation	Data	Read	Read by read-modify-write (RMW) instruction	Write
PDR1	0	Pin state is "L" level.	PDR1 value is "0".	As output port, outputs "L" level.
	1	Pin state is "H" level.	PDR1 value is "1".	As output port, outputs "H" level.*
DDR1	0	Port input enabled		
	1	Port output enabled		
PUL1	0	Pull-up disabled		
	1	Pull-up enabled		

*: If the pin is an N-ch open drain pin, the pin state becomes Hi-Z.

- Correspondence between registers and pins for port 1

	Correspondence between related register bits and pins							
Pin name	P17	P16	P15	P14	P13	P12	P11	P10

DDR1								
PUL1								

*: Though P12 has no pull-up function, bit2 in the PUL1 register can still be accessed. The operation of P12 is not affected by the setting of bit2 in the PUL1 register.

(4) Port 1 operations

- Operation as an output port
 - A pin becomes an output port if the bit in the DDR1 register corresponding to that pin is set to “1”.
 - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
 - When a pin is used as an output port, it outputs the value of the PDR1 register to external pins.
 - If data is written to the PDR1 register, the value is stored in the output latch and is output to the pin set as an output port as it is.
 - Reading the PDR1 register returns the PDR1 register value.
- Operation as an input port
 - A pin becomes an input port if the bit in the DDR1 register corresponding to that pin is set to “0”.
 - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
 - If data is written to the PDR1 register, the value is stored in the output latch but is not output to the pin set as an input port.
 - Reading the PDR1 register returns the pin value. However, if the read-modify-write (RMW) type of instruction is used to read the PDR1 register, the PDR1 register value is returned.
- Operation as a peripheral function output pin
 - A pin becomes a peripheral function output pin if the peripheral output function is enabled by setting the output enable bit of a peripheral function corresponding to that pin.
 - The pin value can be read from the PDR1 register even if the peripheral function output is enabled. Therefore, the output value of a peripheral function can be read by the read operation on the PDR1 register. However, if the read-modify-write (RMW) type of instruction is used to read the PDR1 register, the PDR1 register value is returned.
- Operation as a peripheral function input pin
 - To set a pin as an input port, set the bit in the DDR1 register corresponding to the input pin of a peripheral function to “0”.
 - Reading the PDR1 register returns the pin value, regardless of whether the peripheral function uses that pin as its input pin. However, if the read-modify-write (RMW) type of instruction is used to read the PDR1 register, the PDR1 register value is returned.
- Operation at reset

If the CPU is reset, all bits in the DDR1 register are initialized to “0” and port input is enabled.
- Operation in stop mode and watch mode
 - If the pin state setting bit in the standby control register (STBC:SPL) is set to “1” and the device transits to stop mode or watch mode, the pin is compulsorily made to enter the high impedance state regardless of the DDR1 register value. The input of that pin is locked to “L” level and blocked in order to prevent leaks due to input open.
 - If the pin state setting bit is “0”, the state of the port I/O or that of the peripheral function I/O remains unchanged and the output level is maintained.
- Operation of the pull-up register

Setting the bit in the PUL1 register to “1” makes the pull-up resistor be internally connected to the pin. When the pin output is “L” level, the pull-up resistor is disconnected regardless of the value of the PUL1 register.

3. Port 4

Port 4 is a general-purpose I/O port. This section focuses on its functions as a general-purpose I/O port. For details of peripheral functions, refer to their respective chapters in the hardware manual of the MB95690K Series.

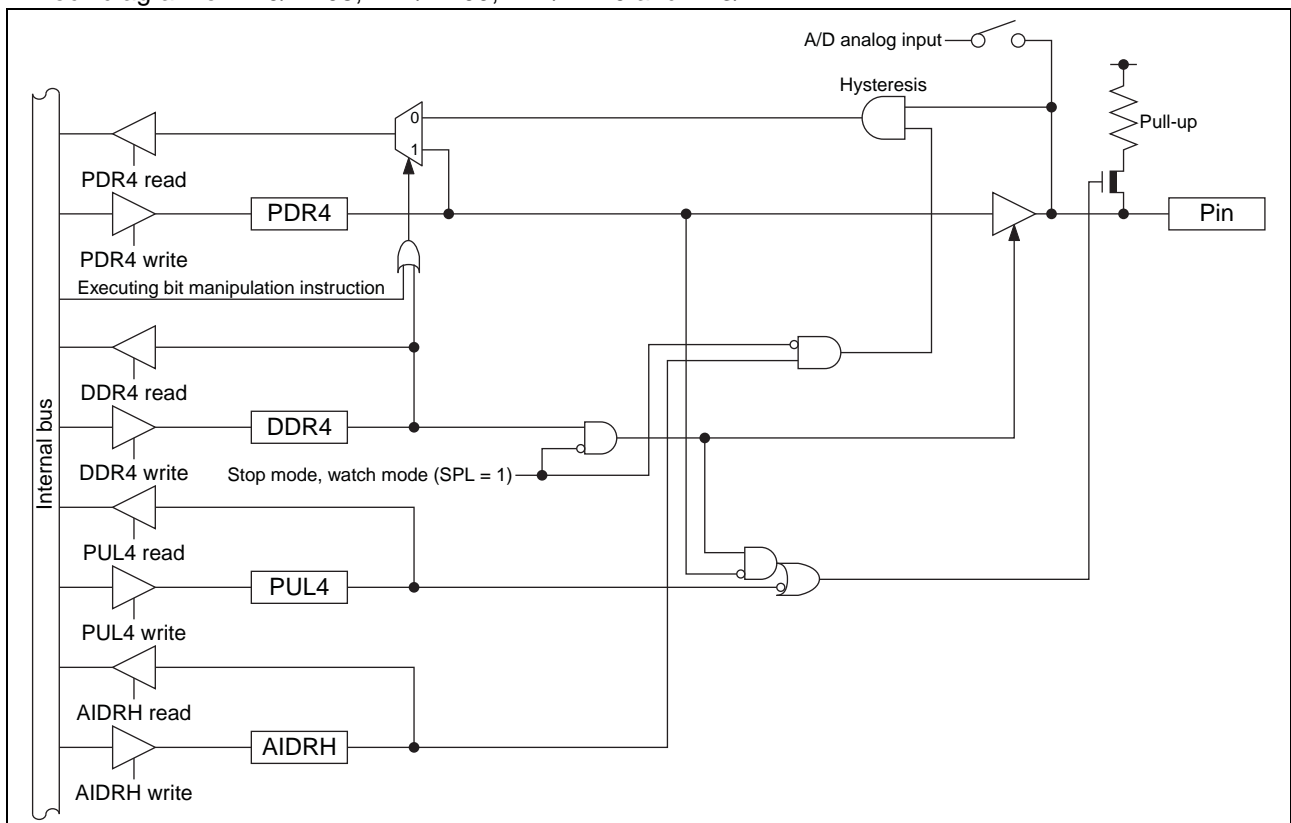

(1) Port 4 configuration

Port 4 is made up of the following elements.

- General-purpose I/O pins/peripheral function I/O pins
- Port 4 data register (PDR4)
- Port 4 direction register (DDR4)
- Port 4 pull-up register (PUL4)
- A/D input disable register (upper) (AIDRH)

(2) Block diagrams of port 4

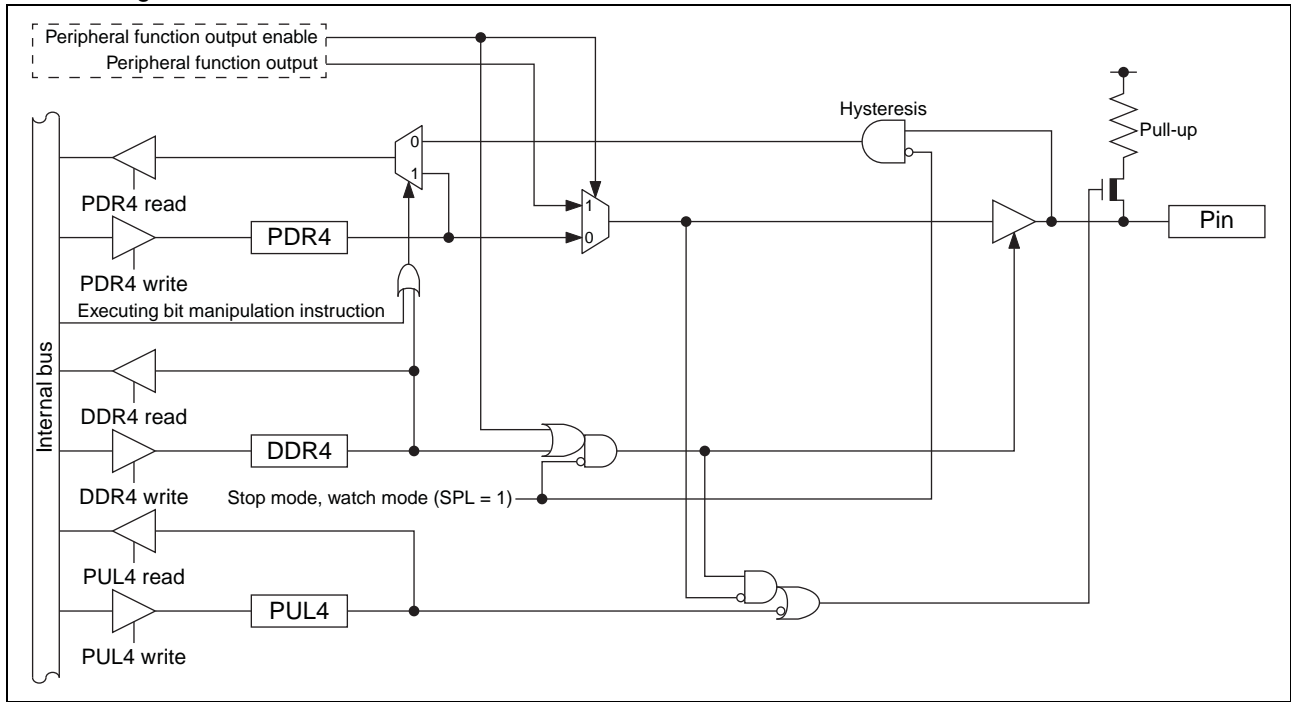

- P40/AN08 pin
This pin has the following peripheral function:

(3) Port 4 registers

- Port 4 register functions

Register abbreviation	Data	Read	Read by read-modify-write (RMW) instruction	Write
PDR4	0	Pin state is "L" level.	PDR4 value is "0".	As output port, outputs "L" level.
	1	Pin state is "H" level.	PDR4 value is "1".	As output port, outputs "H" level.
DDR4	0	Port input enabled		
	1	Port output enabled		
PUL4	0	Pull-up disabled		
	1	Pull-up enabled		
AIDRH	0	Analog input enabled		
	1	Port input enabled		

- Correspondence between registers and pins for port 4

Pin name	Correspondence between related register bits and pins							
	P47	P46	P45	P44	P43	P42	P41	P40
PDR4	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
DDR4								
PUL4								
AIDRH								

(4) Port 4 operations

- Operation as an output port
 - A pin becomes an output port if the bit in the DDR4 register corresponding to that pin is set to “1”.
 - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
 - When a pin is used as an output port, it outputs the value of the PDR4 register to external pins.
 - If data is written to the PDR4 register, the value is stored in the output latch and is output to the pin set as an output port as it is.
 - Reading the PDR4 register returns the PDR4 register value.
- Operation as an input port
 - A pin becomes an input port if the bit in the DDR4 register corresponding to that pin is set to “0”.
 - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
 - When using a pin shared with the analog input function as an input port, set the corresponding bit in the A/D input disable register (upper) (AIDRH) to “1”
 - If data is written to the PDR4 register, the value is stored in the output latch but is not output to the pin set as an input port.
 - Reading the PDR4 register returns the pin value. However, if the read-modify-write (RMW) type of instruction is used to read the PDR4 register, the PDR4 register value is returned.
- Operation as a peripheral function output pin
 - A pin becomes a peripheral function output pin if the peripheral output function is enabled by setting the output enable bit of a peripheral function corresponding to that pin.
 - The pin value can be read from the PDR4 register even if the peripheral function output is enabled. Therefore, the output value of a peripheral function can be read by the read operation on the PDR4 register. However, if the read-modify-write (RMW) type of instruction is used to read the PDR4 register, the PDR4 register value is returned.
- Operation as a peripheral function input pin
 - To set a pin as an input port, set the bit in the DDR4 register corresponding to the input pin of a peripheral function to “0”.
 - When using a pin shared with the analog input function as another peripheral function input pin, configure it as an input port by setting the bit in the AIDRH register corresponding to that pin to “1”.
 - Reading the PDR4 register returns the pin value, regardless of whether the peripheral function uses that pin as its input pin. However, if the read-modify-write (RMW) type of instruction is used to read the PDR4 register, the PDR4 register value is returned.
- Operation at reset

If the CPU is reset, all bits in the DDR4 register are initialized to “0” and port input is enabled. As for a pin shared with the analog input function, its port input is disabled because the AIDRH register is initialized to “0”.
- Operation in stop mode and watch mode
 - If the pin state setting bit in the standby control register (STBC:SPL) is set to “1” and the device transits to stop mode or watch mode, the pin is compulsorily made to enter the high impedance state regardless of the DDR4 register value. The input of that pin is locked to “L” level and blocked in order to prevent leaks due to input open. However, if the interrupt input of P45/SCK and P47/SIN is enabled by the external interrupt control register ch. 0 (EIC00) of the external interrupt circuit and the interrupt pin selection circuit control register (WICR) of the interrupt pin selection circuit, the input is enabled and is not blocked.
 - If the pin state setting bit is “0”, the state of the port I/O or that of the peripheral function I/O remains unchanged and the output level is maintained.
- Operation as an analog input pin
 - Set the bit in the DDR4 register bit corresponding to the analog input pin to “0” and the bit corresponding to that pin in the AIDRH register to “0”.
 - For a pin shared with other peripheral functions, disable the output of such peripheral functions. In addition, set the corresponding bit in the PUL4 register to “0”.

(Continued)

(Continued)

- Operation of the pull-up register

Setting the bit in the PUL4 register to “1” makes the pull-up resistor be internally connected to the pin. When the pin output is “L” level, the pull-up resistor is disconnected regardless of the value of the PUL4 register.

4. Port 6

Port 6 is a general-purpose I/O port. This section focuses on its functions as a general-purpose I/O port. For details of peripheral functions, refer to their respective chapters in the hardware manual of the MB95690K Series.

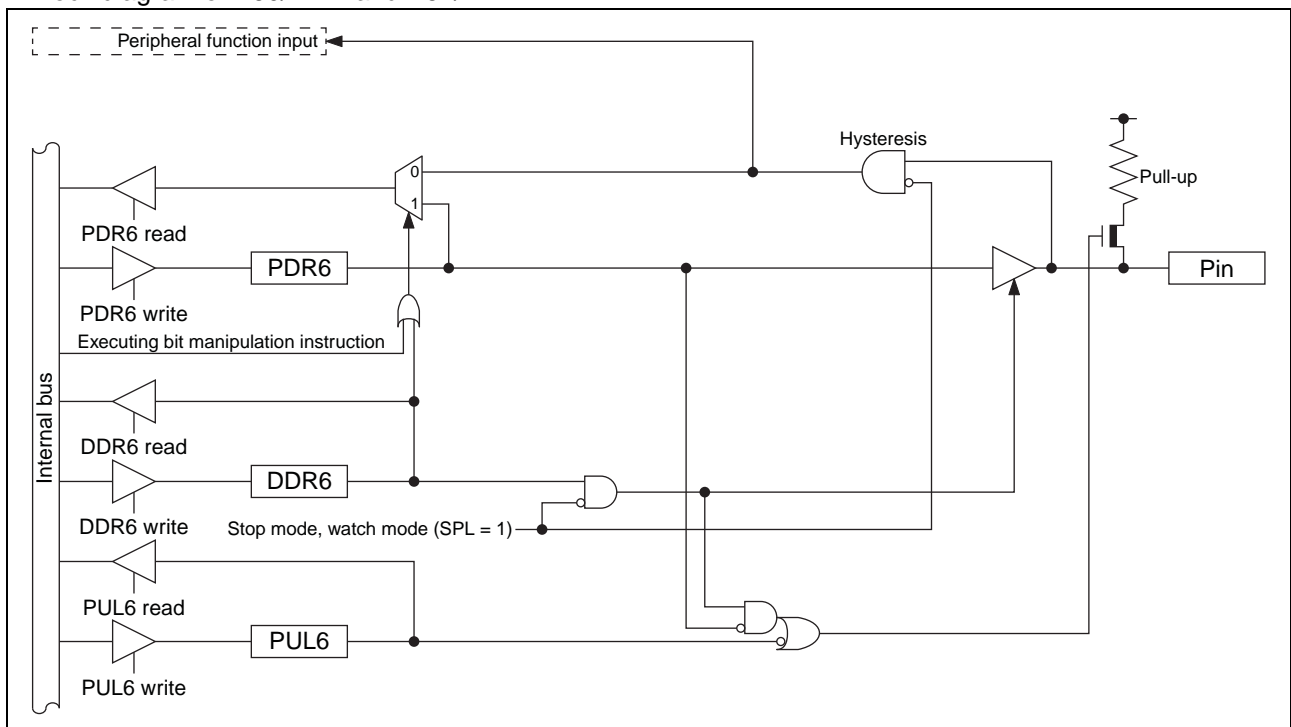

(1) Port 6 configuration

Port 6 is made up of the following elements.

- General-purpose I/O pins/peripheral function I/O pins
- Port 6 data register (PDR6)
- Port 6 direction register (DDR6)
- Port 6 pull-up register (PUL6)

(2) Block diagrams of port 6

(4) Port 6 operations

- Operation as an output port
 - A pin becomes an output port if the bit in the DDR6 register corresponding to that pin is set to “1”.
 - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
 - When a pin is used as an output port, it outputs the value of the PDR6 register to external pins.
 - If data is written to the PDR6 register, the value is stored in the output latch and is output to the pin set as an output port as it is.
 - Reading the PDR6 register returns the PDR6 register value.
- Operation as an input port
 - A pin becomes an input port if the bit in the DDR6 register corresponding to that pin is set to “0”.
 - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
 - If data is written to the PDR6 register, the value is stored in the output latch but is not output to the pin set as an input port.
 - Reading the PDR6 register returns the pin value. However, if the read-modify-write (RMW) type of instruction is used to read the PDR6 register, the PDR6 register value is returned.
- Operation as a peripheral function output pin
 - A pin becomes a peripheral function output pin if the peripheral output function is enabled by setting the output enable bit of a peripheral function corresponding to that pin.
 - The pin value can be read from the PDR6 register even if the peripheral function output is enabled. Therefore, the output value of a peripheral function can be read by the read operation on the PDR6 register. However, if the read-modify-write (RMW) type of instruction is used to read the PDR6 register, the PDR6 register value is returned.
- Operation as a peripheral function input pin
 - To set a pin as an input port, set the bit in the DDR6 register corresponding to the input pin of a peripheral function to “0”.
 - Reading the PDR6 register returns the pin value, regardless of whether the peripheral function uses that pin as its input pin. However, if the read-modify-write (RMW) type of instruction is used to read the PDR6 register, the PDR6 register value is returned.
- Operation at reset

If the CPU is reset, all bits in the DDR6 register are initialized to “0” and port input is enabled.
- Operation in stop mode and watch mode
 - If the pin state setting bit in the standby control register (STBC:SPL) is set to “1” and the device transits to stop mode or watch mode, the pin is compulsorily made to enter the high impedance state regardless of the DDR6 register value. The input of that pin is locked to “L” level and blocked in order to prevent leaks due to input open. However, if the interrupt input of P64/EC1 and P67/TRG1 is enabled by the external interrupt control register ch. 0 (EIC00) of the external interrupt circuit and the interrupt pin selection circuit control register (WICR) of the interrupt pin selection circuit, the input is enabled and is not blocked.
 - If the pin state setting bit is “0”, the state of the port I/O or that of the peripheral function I/O remains unchanged and the output level is maintained.
- Operation of the pull-up register

Setting the bit in the PUL6 register to “1” makes the pull-up resistor be internally connected to the pin. When the pin output is “L” level, the pull-up resistor is disconnected regardless of the value of the PUL6 register.

PUL7					-	-		

(4) Port 7 operations

- Operation as an output port
 - A pin becomes an output port if the bit in the DDR7 register corresponding to that pin is set to “1”.
 - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
 - When a pin is used as an output port, it outputs the value of the PDR7 register to external pins.
 - If data is written to the PDR7 register, the value is stored in the output latch and is output to the pin set as an output port as it is.
 - Reading the PDR7 register returns the PDR7 register value.
- Operation as an input port
 - A pin becomes an input port if the bit in the DDR7 register corresponding to that pin is set to “0”.
 - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
 - If data is written to the PDR7 register, the value is stored in the output latch but is not output to the pin set as an input port.
 - Reading the PDR7 register returns the pin value. However, if the read-modify-write (RMW) type of instruction is used to read the PDR7 register, the PDR7 register value is returned.
- Operation as a peripheral function output pin
 - A pin becomes a peripheral function output pin if the peripheral output function is enabled by setting the output enable bit of a peripheral function corresponding to that pin.
 - The pin value can be read from the PDR7 register even if the peripheral function output is enabled. Therefore, the output value of a peripheral function can be read by the read operation on the PDR7 register. However, if the read-modify-write (RMW) type of instruction is used to read the PDR7 register, the PDR7 register value is returned.
- Operation as a peripheral function input pin
 - To set a pin as an input port, set the bit in the DDR7 register corresponding to the input pin of a peripheral function to “0”.
 - Reading the PDR7 register returns the pin value, regardless of whether the peripheral function uses that pin as its input pin. However, if the read-modify-write (RMW) type of instruction is used to read the PDR7 register, the PDR7 register value is returned.
- Operation at reset

If the CPU is reset, all bits in the DDR7 register are initialized to “0” and port input is enabled.
- Operation in stop mode and watch mode
 - If the pin state setting bit in the standby control register (STBC:SPL) is set to “1” and the device transits to stop mode or watch mode, the pin is compulsorily made to enter the high impedance state regardless of the DDR7 register value. The input of that pin is locked to “L” level and blocked in order to prevent leaks due to input open. However, if the interrupt input of P74/EC0, P75/UCK0 and P77/UI0 is enabled by the external interrupt control register ch. 0 (EIC00) of the external interrupt circuit and the interrupt pin selection circuit control register (WICR) of the interrupt pin selection circuit, the input is enabled and is not blocked.
 - If the pin state setting bit is “0”, the state of the port I/O or that of the peripheral function I/O remains unchanged and the output level is maintained.
- Operation of the pull-up register

Setting the bit in the PUL7 register to “1” makes the pull-up resistor be internally connected to the pin. When the pin output is “L” level, the pull-up resistor is disconnected regardless of the value of the PUL7 register.

6. Port F

Port F is a general-purpose I/O port. This section focuses on its functions as a general-purpose I/O port. For details of peripheral functions, refer to their respective chapters in the hardware manual of the MB95690K Series.

(1) Port F configuration

Port F is made up of the following elements.

- General-purpose I/O pins/peripheral function I/O pins
- Port F data register (PDRF)
- Port F direction register (DDRF)

(2) Block diagrams of port F

• PF0/X0 pin

This pin has the following peripheral function:

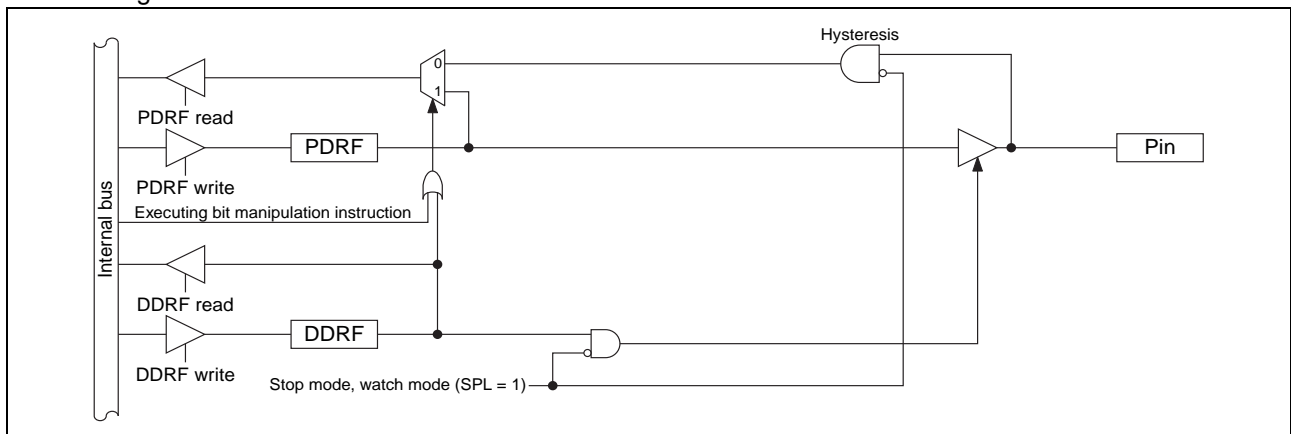

- Main clock input oscillation pin (X0)

• PF1/X1 pin

This pin has the following peripheral function:

- Main clock I/O oscillation pin (X1)

• Block diagram of PF0/X0 and PF1/X1

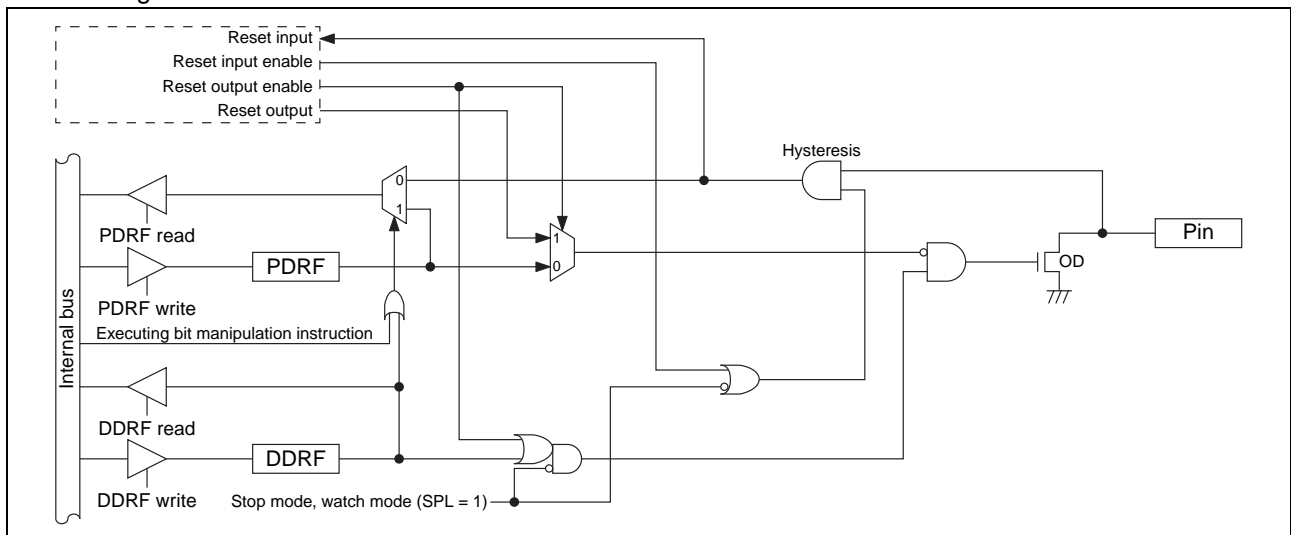

• PF2/ $\overline{\text{RST}}$ pin

This pin has the following peripheral function:

- Reset pin (RST)

• Block diagram of PF2/ $\overline{\text{RST}}$

(3) Port F registers

- Port F register functions

Register abbreviation	Data	Read	Read by read-modify-write (RMW) instruction	Write
PDRF	0	Pin state is "L" level.	PDRF value is "0".	As output port, outputs "L" level.
	1	Pin state is "H" level.	PDRF value is "1".	As output port, outputs "H" level.*
DDRF	0	Port input enabled		
	1	Port output enabled		

*: If the pin is an N-ch open drain pin, the pin state becomes Hi-Z.

- Correspondence between registers and pins for port F

Pin name	Correspondence between related register bits and pins							
	-	-	-	-	-	PF2	PF1	PF0
PDRF	-	-	-	-	-	bit2*	bit1	bit0
DDRF	-	-	-	-	-			

*: When the external reset is selected (SYSC:RSTEN = 1), the port function cannot be used.

(4) Port F operations

- Operation as an output port
 - A pin becomes an output port if the bit in the DDRF register corresponding to that pin is set to “1”.
 - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
 - When a pin is used as an output port, it outputs the value of the PDRF register to external pins.
 - If data is written to the PDRF register, the value is stored in the output latch and is output to the pin set as an output port as it is.
 - Reading the PDRF register returns the PDRF register value.
- Operation as an input port
 - A pin becomes an input port if the bit in the DDRF register corresponding to that pin is set to “0”.
 - If data is written to the PDRF register, the value is stored in the output latch but is not output to the pin set as an input port.
 - Reading the PDRF register returns the pin value. However, if the read-modify-write (RMW) type of instruction is used to read the PDRF register, the PDRF register value is returned.
- Operation at reset

If the CPU is reset, all bits in the DDRF register are initialized to “0” and port input is enabled.
- Operation in stop mode and watch mode
 - If the pin state setting bit in the standby control register (STBC:SPL) is set to “1” and the device transits to stop mode or watch mode, the pin is compulsorily made to enter the high impedance state regardless of the DDRF register value. The input of that pin is locked to “L” level and blocked in order to prevent leaks due to input open.
 - If the pin state setting bit is “0”, the state of the port I/O or that of the peripheral function I/O remains unchanged and the output level is maintained.

7. Port G

Port G is a general-purpose I/O port. This section focuses on its functions as a general-purpose I/O port. For details of peripheral functions, refer to their respective chapters in the hardware manual of the MB95690K Series.

(1) Port G configuration

Port G is made up of the following elements.

- General-purpose I/O pins/peripheral function I/O pins
- Port G data register (PDRG)
- Port G direction register (DDRG)
- Port G pull-up register (PULG)

(2) Block diagram of port G

• PG1/X0A/SNI1 pin

This pin has the following peripheral functions:

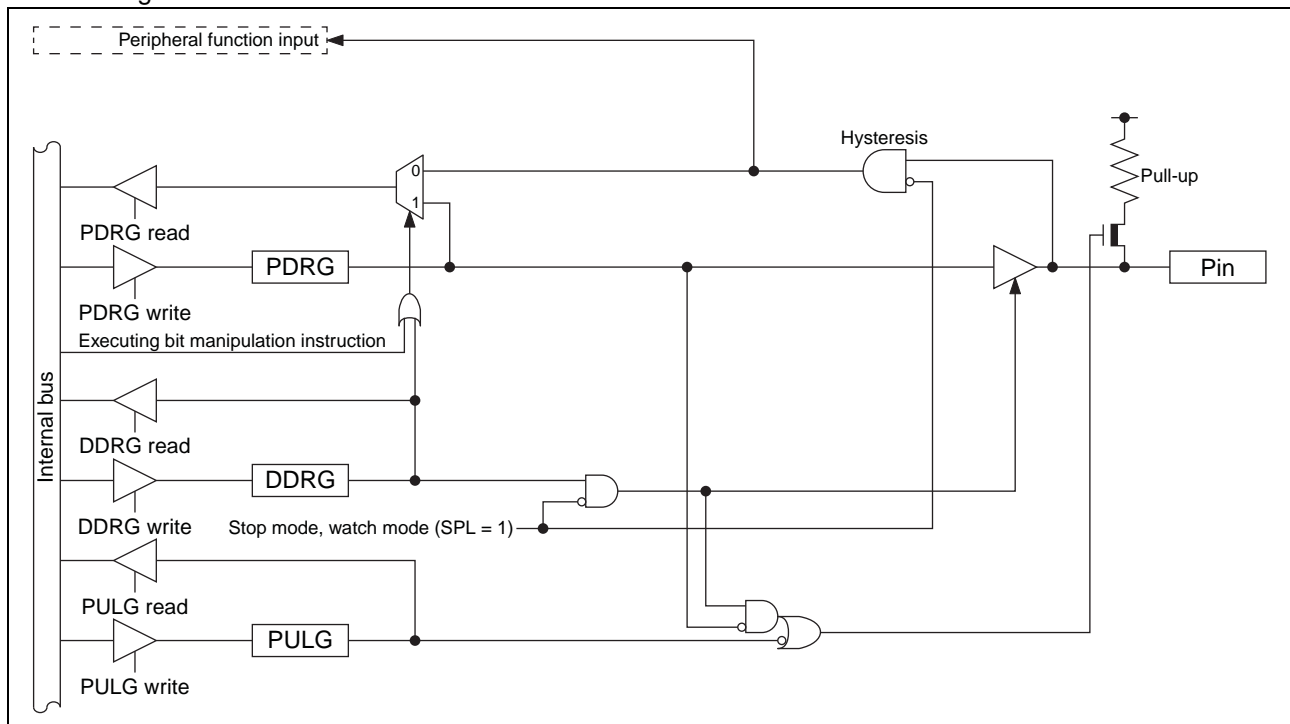

- Subclock input oscillation pin (X0A)
- Trigger input pin for the position detection function of the MPG waveform sequencer (SNI1)

• PG2/X1A/SNI2 pin

This pin has the following peripheral functions:

- Subclock I/O oscillation pin (X1A)
- Trigger input pin for the position detection function of the MPG waveform sequencer (SNI2)

• Block diagram of PG1/X0A/SNI1 and PG2/X1A/SNI2

(4) Port G operations

- Operation as an output port
 - A pin becomes an output port if the bit in the DDRG register corresponding to that pin is set to “1”.
 - For a pin shared with other peripheral functions, disable the output of such peripheral functions.
 - When a pin is used as an output port, it outputs the value of the PDRG register to external pins.
 - If data is written to the PDRG register, the value is stored in the output latch and is output to the pin set as an output port as it is.
 - Reading the PDRG register returns the PDRG register value.
- Operation as an input port
 - A pin becomes an input port if the bit in the DDRG register corresponding to that pin is set to “0”.
 - If data is written to the PDRG register, the value is stored in the output latch but is not output to the pin set as an input port.
 - Reading the PDRG register returns the pin value. However, if the read-modify-write (RMW) type of instruction is used to read the PDRG register, the PDRG register value is returned.
- Operation as a peripheral function input pin
 - To set a pin as an input port, set the bit in the DDRG register corresponding to the input pin of a peripheral function to “0”.
 - Reading the PDRG register returns the pin value, regardless of whether the peripheral function uses that pin as its input pin. However, if the read-modify-write (RMW) type of instruction is used to read the PDRG register, the PDRG register value is returned.
- Operation at reset

If the CPU is reset, all bits in the DDRG register are initialized to “0” and port input is enabled.
- Operation in stop mode and watch mode
 - If the pin state setting bit in the standby control register (STBC:SPL) is set to “1” and the device transits to stop mode or watch mode, the pin is compulsorily made to enter the high impedance state regardless of the DDRG register value. The input of that pin is locked to “L” level and blocked in order to prevent leaks due to input open.
 - If the pin state setting bit is “0”, the state of the port I/O or that of the peripheral function I/O remains unchanged and the output level is maintained.
- Operation of the pull-up register

Setting the bit in the PULG register to “1” makes the pull-up resistor be internally connected to the pin. When the pin output is “L” level, the pull-up resistor is disconnected regardless of the value of the PULG register.

MB95690K Series

■ INTERRUPT SOURCE TABLE

Interrupt source	Interrupt request number	Vector table address		Interrupt level setting register		Priority order of interrupt sources of the same level (occurring simultaneously)
		Upper	Lower	Register	Bit	
External interrupt ch. 0	IRQ00	0xFFFA	0xFFFB	ILR0	L00 [1:0]	<div style="text-align: center;">High</div> <div style="text-align: center;">Low</div>

SPL: Pin state setting bit in the standby control register (STBC:SPL)

Hi-Z: High impedance

*1: The pin stays at the state shown when configured as a general-purpose I/O port.

*2: "Input blocked" means direct input gate operation from the pin is disabled.

*3: "Input enabled" means that the input function is enabled. While the input function is enabled, a pull-up or pull-down operation has to be performed in order to prevent leaks due to external input. If a pin is used as an output port, its pin state is the same as that of other ports.

*4: The PF2/RST pin stays at the state shown when configured as a reset pin.

*5: The pull-up control setting is still effective.

*6: Though input is blocked, an external interrupt can be input when the external interrupt request is enabled, and an analog signal can also be input to generate a comparator interrupt when the comparator interrupt is enabled.

*7: Though input is blocked, an external interrupt can be input when the external interrupt request is enabled.

*8: The output function of the comparator is still in operation in stop mode and watch mode.

*9: The I²C bus interface can wake up the MCU in stop mode or watch mode when its MCU standby mode wakeup function is enabled. For details of the MCU standby mode wakeup function, refer to the hardware manual of the MB95690K Series.

MB95690K Series

■ ELECTRICAL CHARACTERISTICS

1. Absolute Maximum Ratings

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage*1	V _{CC}	V _{SS} - 0.3	V _{SS} + 6	V	
Input voltage*1	V _I	V _{SS} - 0.3	V _{SS} + 6	V	*2
Output voltage*1	V _O	V _{SS} - 0.3	V _{SS} + 6	V	*2
Maximum clamp current	I _{CLAMP}	-2	+2	mA	Applicable to specific pins*3
Total maximum clamp current	Σ I _{CLAMP}	—	20	mA	Applicable to specific pins*3
“L” level maximum output current	I _{OL}	—	15	mA	
“L” level average current	I _{OLAV1}	—	4	mA	Other than P60 to P67 Average output current = operating current × operating ratio (1 pin)
	I _{OLAV2}		12		P60 to P67 Average output current = operating current × operating ratio (1 pin)
“L” level total maximum output current	ΣI _{OL}	—	100	mA	
“L” level total average output current	ΣI _{OLAV}	—	37	mA	Total average output current = operating current × operating ratio (Total number of pins)
“H” level maximum output current	I _{OH}	—	-15	mA	
“H” level average current	I _{OHAV1}	—	-4	mA	Other than P60 to P67 Average output current = operating current × operating ratio (1 pin)
	I _{OHAV2}		-8		P60 to P67 Average output current = operating current × operating ratio (1 pin)
“H” level total maximum output current	ΣI _{OH}	—	-100	mA	
“H” level total average output current	ΣI _{OHAV}	—	-47	mA	Total average output current = operating current × operating ratio (Total number of pins)
Power consumption	P _d	—	320	mW	
Operating temperature	T _A	-40	+85	°C	
Storage temperature	T _{stg}	-55	+150	°C	

(Continued)

(Continued)

*1: These parameters are based on the condition that V_{SS} is 0.0 V.

*2: V_1 and V_0 must not exceed $V_{CC} + 0.3$ V. V_1 must not exceed the rated voltage. However, if the maximum current to/from an input is limited by means of an external component, the I_{CLAMP} rating is used instead of the V_i rating.

*3: Specific pins: P00 to P07, P10, P11, P13 to P17, P40 to P47, P60 to P67, P70, P71, P74 to P77, PF0, PF1, PG1, PG2

- Use under recommended operating conditions.
- Use with DC voltage (current).
- The HV (High Voltage) signal is an input signal exceeding the V_{CC} voltage. Always connect a limiting resistor between the HV (High Voltage) signal and the microcontroller before applying the HV (High Voltage) signal.
- The value of the limiting resistor should be set to a value at which the current to be input to the microcontroller pin when the HV (High Voltage) signal is input is below the standard value, irrespective of whether the current is transient current or stationary current.
- When the microcontroller drive current is low, such as in low power consumption modes, the HV (High Voltage) input potential may pass through the protective diode to increase the potential of the V_{CC} pin, affecting other devices.
- If the HV (High Voltage) signal is input when the microcontroller power supply is off (not fixed at 0 V), since power is supplied from the pins, incomplete operations may be executed.
- If the HV (High Voltage) input is input after power-on, since power is supplied from the pins, the voltage of power supply may not be sufficient to enable a power-on reset.
- Do not leave the HV (High Voltage) input pin unconnected.
- Example of a recommended circuit:

- Input/Output equivalent circuit

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

MB95690K Series

2. Recommended Operating Conditions

(V_{SS} = 0.0 V)

Parameter	Symbol	Value		Unit	Remarks
		Min	Max		
Power supply voltage	V _{CC}	2.88	5.5	V	
Decoupling capacitor	C _s	0.022	1	μF	*
Operating temperature	T _A	-40	+85	°C	Other than on-chip debug mode
		+5	+35		On-chip debug mode

*: Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. The bypass capacitor for the V_{CC} pin must have a capacitance larger than C_s. For the connection to a decoupling capacitor C_s, see the diagram below. To prevent the device from unintentionally entering an unknown mode due to noise, minimize the distance between the C pin and C_s and the distance between C_s and the V_{SS} pin when designing the layout of a printed circuit board.

• DBG / $\overline{\text{RST}}$ / C pins connection diagram

*: Since the DBG pin becomes a communication pin in on-chip debug mode, set a pull-up resistor value suiting the input/output specifications of P12/DBG.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure. No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

MB95690K Series

3. DC Characteristics

($V_{CC} = 5.0 V \pm 10\%$, $V_{SS} = 0.0 V$, $T_A = -40\text{ }^\circ\text{C}$ to $+85\text{ }^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ	Max		
"H" level input voltage	V_{IH1}	P47, P72, P73, P77	—	$0.7 V_{CC}$	—	$V_{CC} + 0.3$	V	CMOS input level
	V_{IHS}	Other than P47, P72, P73, P77, PF2	—	$0.8 V_{CC}$	—	$V_{CC} + 0.3$	V	Hysteresis input
	V_{IHM}	PF2	—	$0.8 V_{CC}$	—	$V_{CC} + 0.3$	V	Hysteresis input
"L" level input voltage	V_{IL1}	P47, P72, P73, P77	—	$V_{SS} - 0.3$	—	$0.3 V_{CC}$	V	CMOS input level
	V_{ILS}	Other than P47, P72, P73, P77, PF2	—	$V_{SS} - 0.3$	—	$0.2 V_{CC}$	V	Hysteresis input

(Continued)

(Continued)

($V_{CC} = 5.0\text{ V} \pm 10\%$, $V_{SS} = 0.0\text{ V}$, $T_A = -40\text{ }^\circ\text{C}$ to $+85\text{ }^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ*1	Max*2		
Power supply current*3	I _v	V _{CC}	Current consumption of the comparator	—	60	160	μA	
	I _{LVD}		Current consumption of the low-voltage detection reset circuit	—	4	7	μA	With the LVD reset already enabled by the LVD reset circuit control register (LVDCC)
	I _{CRH}		Current consumption of the main CR oscillator	—	240	320	μA	
	I _{CRL}		Current consumption of the sub-CR oscillator oscillating at 100 kHz	—	7	20	μA	
	I _{INSTBY}		Current consumption difference between normal standby mode and deep standby mode $T_A = +25\text{ }^\circ\text{C}$	—	18	30	μA	

*1: $V_{CC} = 5.0\text{ V}$, $T_A = +25\text{ }^\circ\text{C}$

*2: $V_{CC} = 5.5\text{ V}$, $T_A = +85\text{ }^\circ\text{C}$ (unless otherwise specified)

*3: • The power supply current is determined by the external clock. When the low-voltage detection reset circuit is selected, the power supply current is the sum of adding the current consumption of the low-voltage detection reset circuit (I_{LVD}) to one of the values from I_{CC} to I_{CCCH}. In addition, when both the low-voltage detection option and a CR oscillator are selected, the power supply current is the sum of adding up the current consumption of the low-voltage detection reset circuit (I_{LVD}), the current consumption of the CR oscillators (I_{CRH} or I_{CRL}) and one of the values from I_{CC} to I_{CCCH}. In on-chip debug mode, the main CR oscillator (I_{CRH}) and the low-voltage detection reset circuit are always in operation, and current consumption therefore increases accordingly.

- See “4. AC Characteristics (1) Clock Timing” for F_{CH}, F_{CL}, F_{CRH} and F_{MCRPLL}.
- See “4. AC Characteristics (2) Source Clock/Machine Clock” for F_{MP} and F_{MPL}.
- The power supply current value in standby mode is measured in deep standby mode. The current consumption in normal standby mode is higher than that in deep standby mode. The power supply current value in normal standby mode can be found by adding the current consumption difference between normal standby mode and deep standby mode (I_{INSTBY}) to the power supply current value in deep standby mode. For details of normal standby mode and deep standby mode, refer to “CHAPTER 3 CLOCK CONTROLLER” in the hardware manual of the MB95690K Series.

*1: This is the clock before it is divided according to the division ratio set by the machine clock division ratio select bits (SYCC:DIV[1:0]). This source clock is divided to become a machine clock according to the division ratio set by the machine clock division ratio select bits (SYCC:DIV[1:0]). In addition, a source clock can be selected from the following.

- Main clock divided by 2
- PLL multiplication of main CR clock (Select a multiplier from 2, 2.5, 3 and 4.)
- Main CR clock
- Subclock divided by 2
- Sub-CR clock divided by 2

*2: This is the operating clock of the microcontroller. A machine clock can be selected from the following.

- Source clock (no division)
- Source clock divided by 4
- Source clock divided by 8
- Source clock divided by 16

• Schematic diagram of the clock generation block

- m represents the CS[4:3] bits in the I²C clock control register (ICCR0).
- n represents the CS[2:0] bits in the I²C clock control register (ICCR0).
- The actual timing of the I²C bus interface is determined by the values of m and n set by the machine clock (t_{MCLK}) and the CS[4:0] bits in the ICCR0 register.
- Standard-mode:
 - m and n can be set to values in the following range: 0.9 MHz < t_{MCLK} (machine clock) < 16.25 MHz.
 - The usable frequencies of the machine clock are determined by the settings of m and n as shown below.
 - (m, n) = (1, 8) : 0.9 MHz < t_{MCLK} ≤ 1 MHz
 - (m, n) = (1, 22), (5, 4), (6, 4), (7, 4), (8, 4) : 0.9 MHz < t_{MCLK} ≤ 2 MHz
 - (m, n) = (1, 38), (5, 8), (6, 8), (7, 8), (8, 8) : 0.9 MHz < t_{MCLK} ≤ 4 MHz
 - (m, n) = (1, 98), (5, 22), (6, 22), (7, 22) : 0.9 MHz < t_{MCLK} ≤ 10 MHz
 - (m, n) = (8, 22) : 0.9 MHz < t_{MCLK} ≤ 16.25 MHz
- Fast-mode:
 - m and n can be set to values in the following range: 3.3 MHz < t_{MCLK} (machine clock) < 16.25 MHz.
 - The usable frequencies of the machine clock are determined by the settings of m and n as shown below.
 - (m, n) = (1, 8) : 3.3 MHz < t_{MCLK} ≤ 4 MHz
 - (m, n) = (1, 22), (5, 4) : 3.3 MHz < t_{MCLK} ≤ 8 MHz
 - (m, n) = (1, 38), (6, 4), (7, 4), (8, 4) : 3.3 MHz < t_{MCLK} ≤ 10 MHz
 - (m, n) = (5, 8) : 3.3 MHz < t_{MCLK} ≤ 16.25 MHz

MB95690K Series

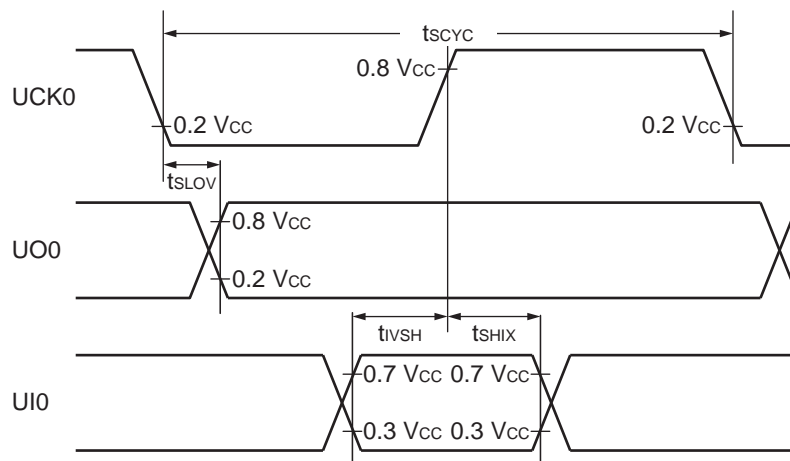

(9) UART/SIO, Serial I/O Timing

($V_{CC} = 5.0\text{ V} \pm 10\%$, $V_{SS} = 0.0\text{ V}$, $T_A = -40\text{ }^\circ\text{C}$ to $+85\text{ }^\circ\text{C}$)

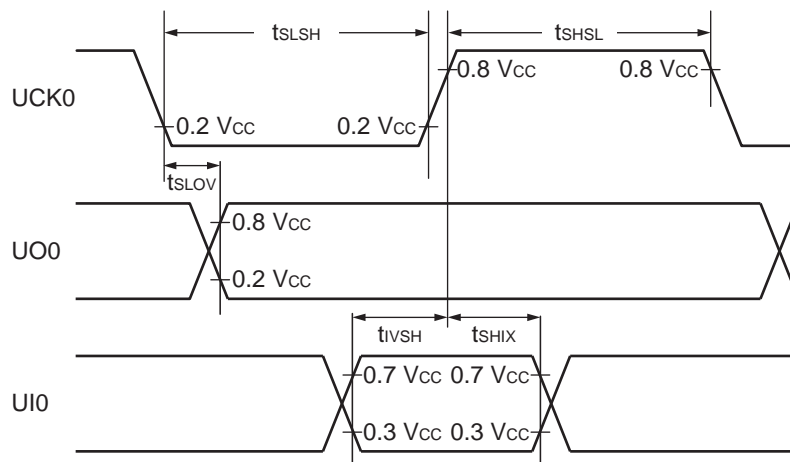

Parameter	Symbol	Pin name	Condition	Value		Unit
				Min	Max	
Serial clock cycle time	t_{SCYC}	UCK0	Internal clock operation	$4 t_{MCLK}^*$	—	ns
UCK ↓ → UO time	t_{SLOV}	UCK0, UO0		-190	+190	ns
Valid UI → UCK ↑	t_{IVSH}	UCK0, UI0		$2 t_{MCLK}^*$	—	ns
UCK ↑ → valid UI hold time	t_{SHIX}	UCK0, UI0		$2 t_{MCLK}^*$	—	ns
Serial clock "H" pulse width	t_{SHSL}	UCK0	External clock operation	$4 t_{MCLK}^*$	—	ns
Serial clock "L" pulse width	t_{SLSH}	UCK0		$4 t_{MCLK}^*$	—	ns
UCK ↓ → UO time	t_{SLOV}	UCK0, UO0		—	190	ns
Valid UI → UCK ↑	t_{IVSH}	UCK0, UI0		$2 t_{MCLK}^*$	—	ns
UCK ↑ → valid UI hold time	t_{SHIX}	UCK0, UI0	$2 t_{MCLK}^*$	—	ns	

*: See "(2) Source Clock/Machine Clock" for t_{MCLK} .

• External shift clock mode

(10) MPG Input Timing

($V_{CC} = 5.0\text{ V} \pm 10\%$, $V_{SS} = 0.0\text{ V}$, $T_A = -40\text{ }^\circ\text{C}$ to $+85\text{ }^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min	Max		
Input pulse width	t_{IWH} t_{IWL}	SNI0 to SNI2, DTTI	—	$4 t_{MCLK}$	—	ns	

MB95690K Series

(11) Comparator Timing

($V_{CC} = 2.88\text{ V to }5.5\text{ V}$, $V_{SS} = 0.0\text{ V}$, $T_A = -40\text{ }^{\circ}\text{C to }+85\text{ }^{\circ}\text{C}$)

Parameter	Pin name	Value			Unit	Remarks
		Min	Typ	Max		
Voltage range	CMP0_P, CMP0_N, CMP1_P, CMP1_N	0	—	$V_{CC} - 1.3$	V	
Offset voltage	CMP0_P, CMP0_N, CMP1_P, CMP1_N	-15	—	+15	mV	
Delay time	CMP0_O, CMP1_O	—	650	1200	ns	Overdrive 5 mV
		—	140	420	ns	Overdrive 50 mV
Power down delay	CMP0_O, CMP1_O	—	—	1200	ns	Power down recovery PD: 1 → 0
Power up stabilization wait time	CMP0_O, CMP1_O	—	—	1200	ns	Output stabilization wait time at power up

(12) BGR for Comparator

($V_{CC} = 2.88 \text{ V to } 5.5 \text{ V}$, $V_{SS} = 0.0 \text{ V}$, $T_A = -40 \text{ }^\circ\text{C to } +85 \text{ }^\circ\text{C}$)

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Power up stabilization wait time	—	—	—	150	μs	Load: 10 pF
Output voltage	VBGR	1.1495	1.21	1.2705	V	

MB95690K Series

5. A/D Converter

(1) A/D Converter Electrical Characteristics

($V_{CC} = 2.7\text{ V to }5.5\text{ V}$, $V_{SS} = 0.0\text{ V}$, $T_A = -40\text{ }^\circ\text{C to }+85\text{ }^\circ\text{C}$)

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Resolution	—	—	—	10	bit	
Total error		-3	—	+3	LSB	
Linearity error		-2.5	—	+2.5	LSB	
Differential linearity error		-1.9	—	+1.9	LSB	
Zero transition voltage	V_{0T}	$V_{SS} - 7.2\text{ LSB}$	$V_{SS} + 0.5\text{ LSB}$	$V_{SS} + 8.2\text{ LSB}$	V	
Full-scale transition voltage	V_{FST}	$V_{CC} - 6.2\text{ LSB}$	$V_{CC} - 1.5\text{ LSB}$	$V_{CC} + 9.2\text{ LSB}$	V	
Compare time	—	3	—	10	μs	$2.7\text{ V} \leq V_{CC} \leq 5.5\text{ V}$
Sampling time	—	0.941	—	∞	μs	$2.7\text{ V} \leq V_{CC} \leq 5.5\text{ V}$, with external impedance $< 3.3\text{ k}\Omega$ and external capacitance = 10 pF
Analog input current	I_{AIN}	-0.3	—	+0.3	μA	
Analog input voltage	V_{AIN}	V_{SS}	—	V_{CC}	V	

(2) Notes on Using A/D Converter

- External impedance of analog input and its sampling time

The A/D converter has a sample and hold circuit. If the external impedance is too high to keep sufficient sampling time, the analog voltage charged to the capacitor of the internal sample and hold circuit is insufficient, adversely affecting A/D conversion precision. Therefore, to satisfy the A/D conversion precision standard, considering the relationship between the external impedance and minimum sampling time, either adjust the register value and operating frequency or decrease the external impedance so that the sampling time is longer than the minimum value. In addition, if sufficient sampling time cannot be secured, connect a capacitor of about 0.1 μF to the analog input pin.

- Analog input equivalent circuit

V_{CC}	R	C
$4.5\text{ V} \leq V_{CC} \leq 5.5\text{ V}$	1.45 k Ω (Max)	14.89 pF (Max)
$2.7\text{ V} \leq V_{CC} < 4.5\text{ V}$	2.7 k Ω (Max)	14.89 pF (Max)

Note: The values are reference values.

- Relationship between external impedance and minimum sampling time

Note: External capacitance = 10 pF

- A/D conversion error

As $|V_{CC} - V_{SS}|$ decreases, the A/D conversion error increases proportionately.

MB95690K Series

(3) Definitions of A/D Converter Terms

- Resolution

It indicates the level of analog variation that can be distinguished by the A/D converter.

When the number of bits is 10, analog voltage can be divided into $2^{10} = 1024$.

- Linearity error (unit: LSB)

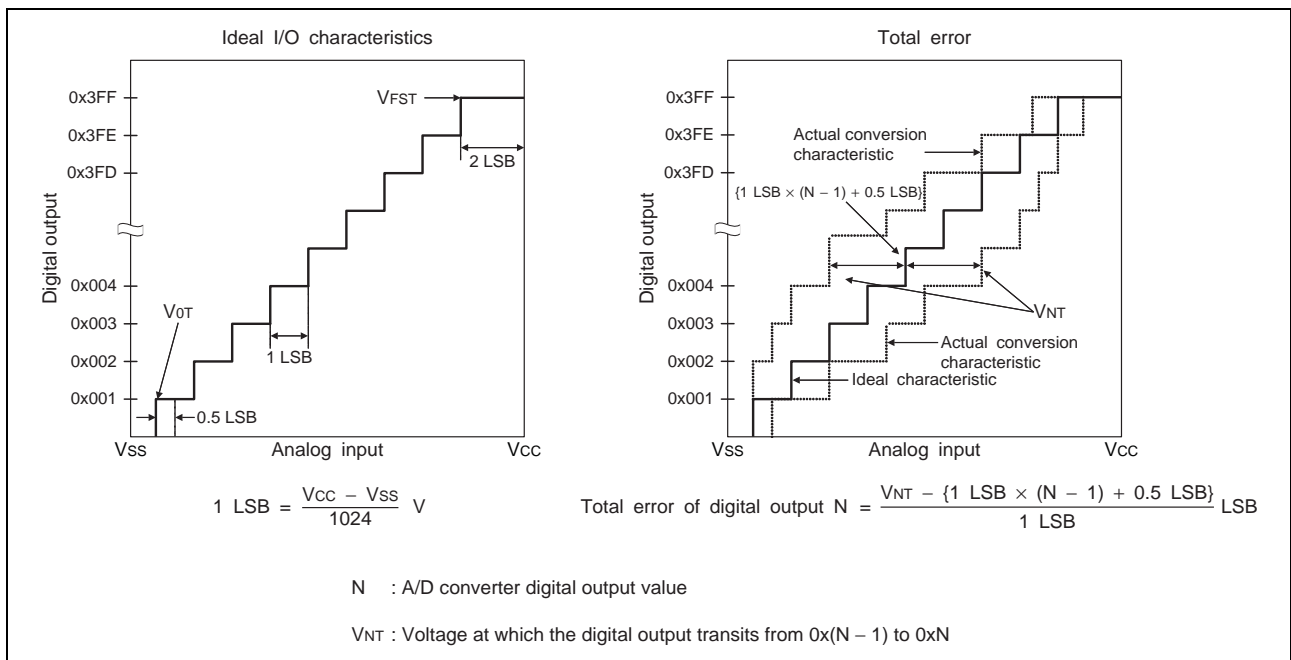

It indicates how much an actual conversion value deviates from the straight line connecting the zero transition point (“0000000000” ← → “0000000001”) of a device to the full-scale transition point (“1111111111” ← → “1111111110”) of the same device.

- Differential linear error (unit: LSB)

It indicates how much the input voltage required to change the output code by 1 LSB deviates from an ideal value.

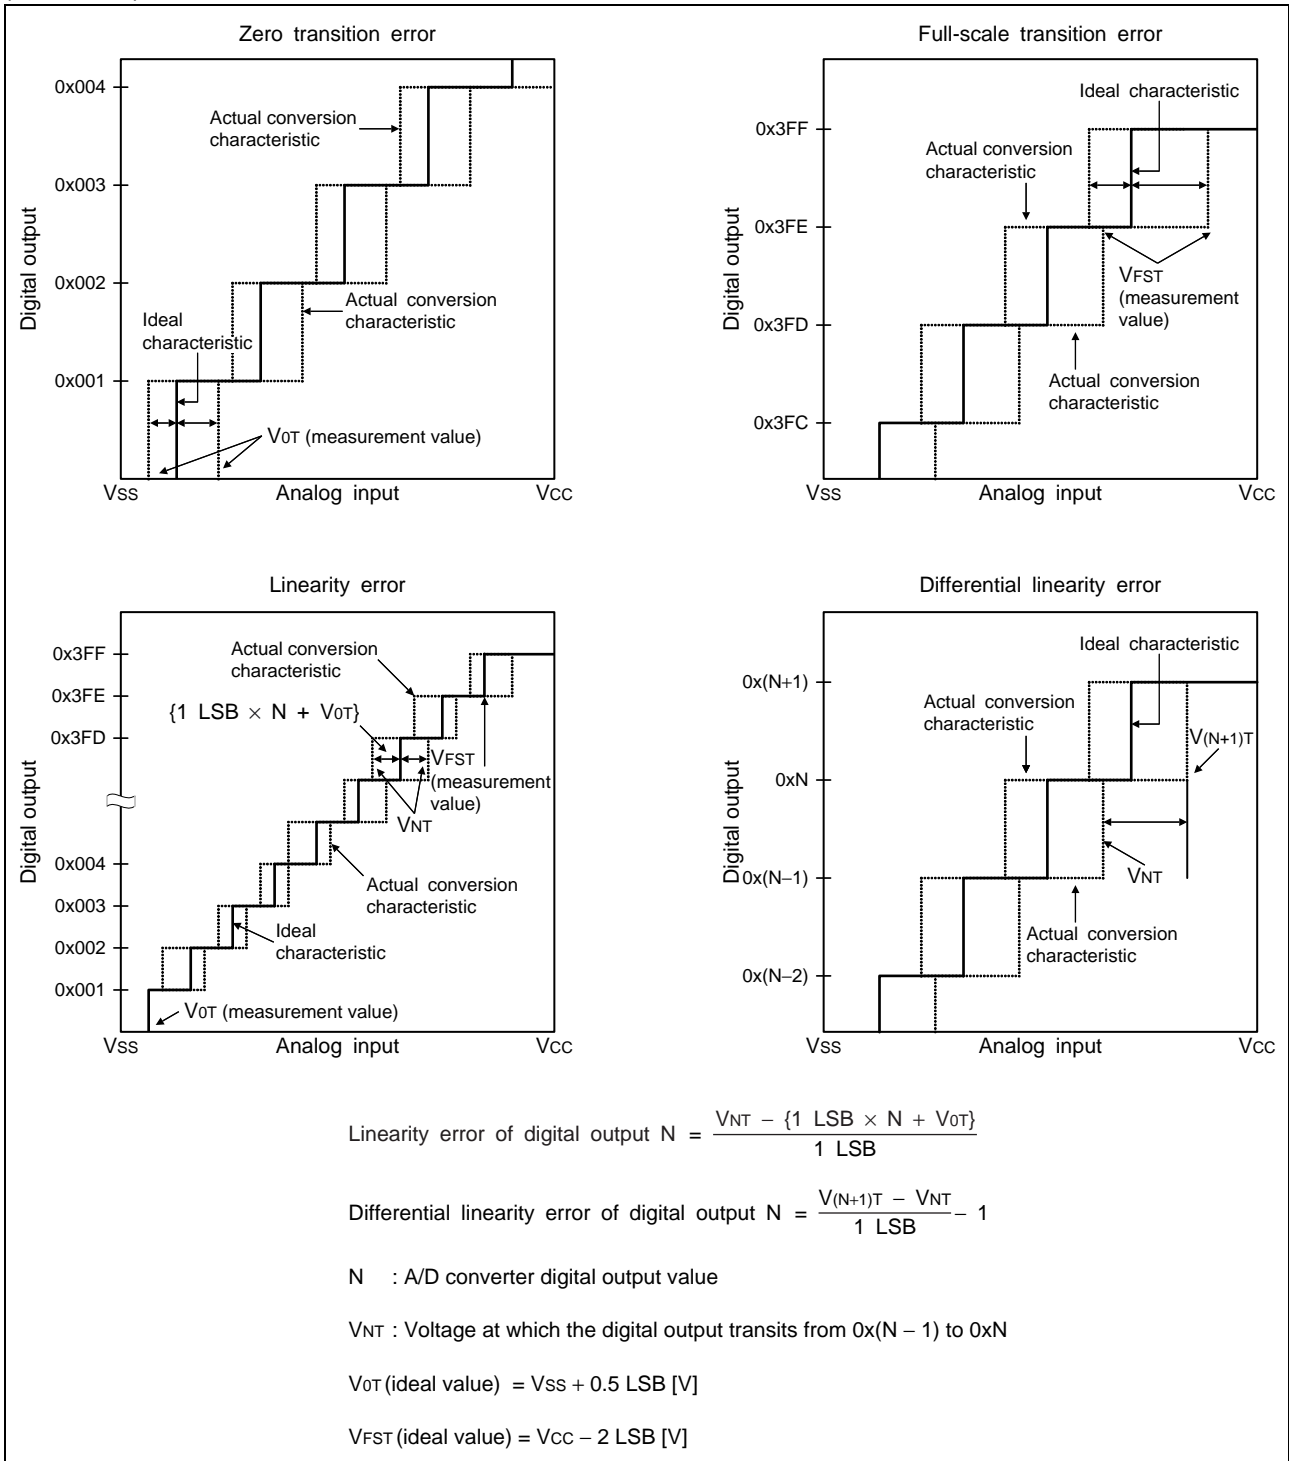

- Total error (unit: LSB)

It indicates the difference between an actual value and a theoretical value. The error can be caused by a zero transition error, a full-scale transition errors, a linearity error, a quantum error, or noise.

6. Flash Memory Program/Erase Characteristics

Parameter	Value			Unit	Remarks
	Min	Typ	Max		
Sector erase time (2 Kbyte sector)	—	0.3* ¹	1.6* ²	s	The time of writing "0x00" prior to erasure is excluded.
Sector erase time (32 Kbyte sector)	—	0.6* ¹	3.1* ²	s	The time of writing "0x00" prior to erasure is excluded.
Byte writing time	—	17	272	μs	System-level overhead is excluded.
Program/erase cycle	100000	—	—	cycle	
Power supply voltage at program/erase	2.4	—	5.5	V	
Flash memory data retention time	20* ³	—	—	year	Average T _A = +85 °C Number of program/erase cycles: 1000 or below
	10* ³	—	—		Average T _A = +85 °C Number of program/erase cycles: 1001 to 10000 inclusive
	5* ³	—	—		Average T _A = +85 °C Number of program/erase cycles: 10001 or above

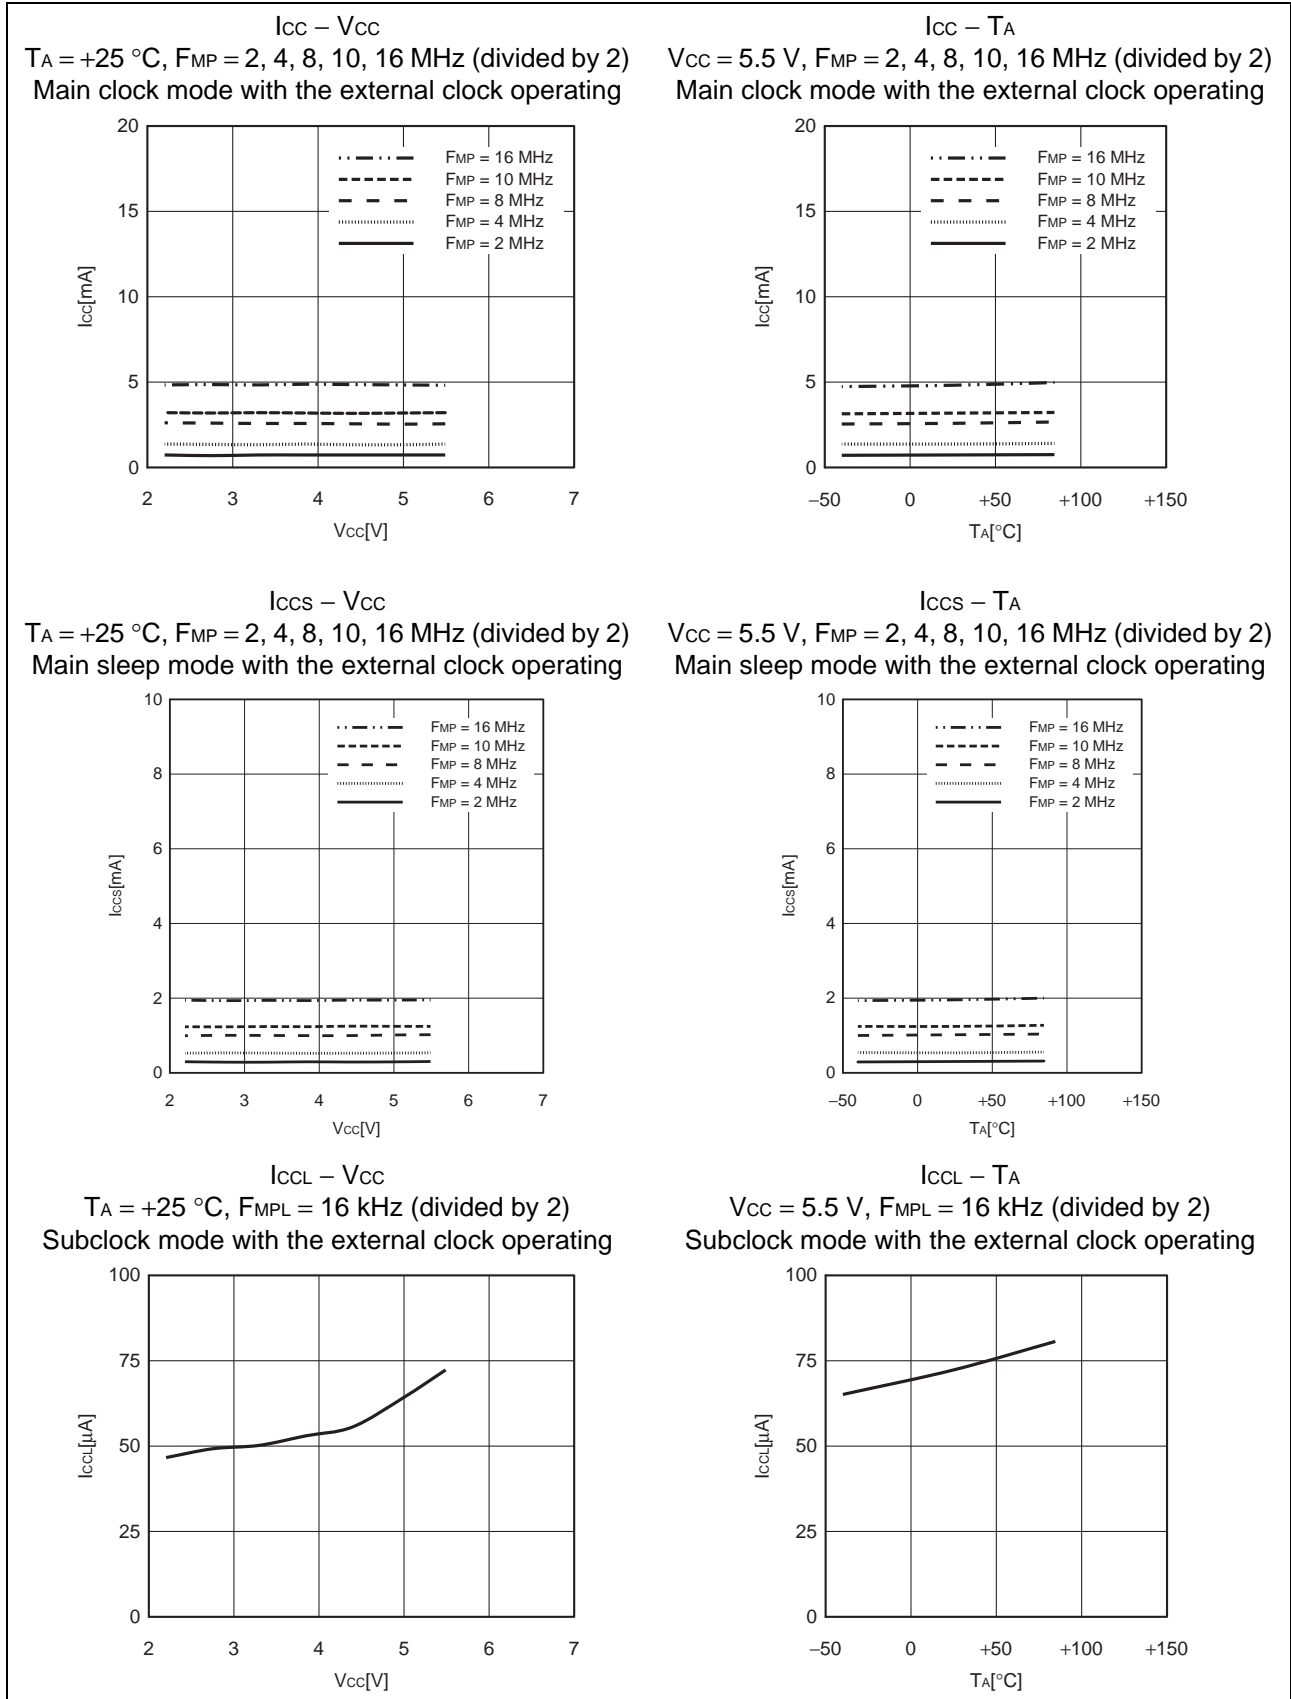

*1: V_{CC} = 5.5 V, T_A = +25 °C, 0 cycle

*2: V_{CC} = 2.4 V, T_A = +85 °C, 100000 cycles

*3: These values were converted from the result of a technology reliability assessment. (These values were converted from the result of a high temperature accelerated test using the Arrhenius equation with the average temperature being +85 °C.)

All Rights Reserved.

The contents of this document are subject to change without notice.

Customers are advised to consult with sales representatives before ordering.

The information, such as descriptions of function and application circuit examples, in this document are presented solely for the purpose of reference to show examples of operations and uses of FUJITSU SEMICONDUCTOR device; FUJITSU SEMICONDUCTOR does not warrant proper operation of the device with respect to use based on such information. When you develop equipment incorporating the device based on such information, you must assume any responsibility arising out of such use of the information.

FUJITSU SEMICONDUCTOR assumes no liability for any damages whatsoever arising out of the use of the information.

Any information in this document, including descriptions of function and schematic diagrams, shall not be construed as license of the use or exercise of any intellectual property right, such as patent right or copyright, or any other right of FUJITSU SEMICONDUCTOR or any third party or does FUJITSU SEMICONDUCTOR warrant non-infringement of any third-party's intellectual property right or other right by using such information. FUJITSU SEMICONDUCTOR assumes no liability for any infringement of the intellectual property rights or other rights of third parties which would result from the use of information contained herein.

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).

Please note that FUJITSU SEMICONDUCTOR will not be liable against you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

Exportation/release of any products described in this document may require necessary procedures in accordance with the regulations of the Foreign Exchange and Foreign Trade Control Law of Japan and/or US export control laws.

The company names and brand names herein are the trademarks or registered trademarks of their respective owners.
